The Wisdom of God
Manifested in the
Works of the Creation:

In Two Parts

VIZ.

The Heavenly Bodies, Elements, Meteors, Fossils, Vegetables, Animals,
(Beasts, Birds, Fishes, and Insects); more particularly in the Body of the Earth,
its Figure, Motion, and Consistency; and in the admirable Structure of the
Bodies of Man, and other Animals; as also in their Generation, &c. With
Answers to some Objections.

By John Ray, late Fellow of the Royal Society.

London:
Printed by R. Harbin, for William Innys, at the Prince's-Arms in St Paul's
Church Yard. 1717.

To the much Honoured and truly Religious Lady,
The
Lady Lettice Wendy,
of
Wendy in Cambridgeshire

Madam,

Two or Three Reasons induce me to present this Discourse to your Ladyship, and to make
choice of you for its Patroness: First, Because I owe it to the Liberality of your honoured
Brother, that I have this Leisure to write any Thing. Secondly, Because also your many and
signal Favours, seeing I am not in a Capacity to requite them, seem to exact from me at least
a Publick Acknowledgment, which such a Dedication gives me an Opportunity to make.
Thirdly, Because of such Kind of Writings, I know not where to choose a more able Judge,
or more candid Reader. I am Sensible that you do so much abhor any Thing that looks like
Flattery, that out of an Excess of Modesty, you cannot patiently bear the hearing of your
own just Commendations; and therefore, should I enlarge upon that Subject, I know I should
have but little Thanks for my Pains.

Indeed, you have much better Motives to do well, than the Praise of Men, the Favour of
God, Peace of Conscience, the Hope and Expectation of a future Reward of Eternal
Happiness and, therefore, I had rather write of you to others, to provoke them to imitate so
excellent an Example, than to Yourself; to encourage You in Your Christian Course, and to
fortify You in Your Athletick Conflicts with the greatest of Temporal Evils, Bodily Pain and
Anguish; tho' I do not know why You should reject any Consideration that may conduce to support You under so heavy Pressures, and of so long Continuance; of which, to ingenuous Natures, true Honour, that is, the current Testimony and Approbation of good Men, is not the meanest. No less Man than St. Augustin was doubtful, whether the Extremity of Bodily Pain were not the greatest Evil that Humane Nature was capable of suffering:

Nay (saith he) I was sometimes compelled to consent to Cornelius Celsius, that it was so; neither did his Reasons seem to me absurd; we being compounded of two Parts, Soul and Body, of which the first is the better, the latter the worser: The greatest Good must be the best thing belonging to the better Part that is Wisdom and the greatest Evil the worst Thing incident to the worser Part (the Body) that is Pain.

Now, tho' I know not whether this Reason be firm and conclusive, yet I am of Accord with him, that of all the Evils we are sensible of in this World, it is the foremost; the most resolute Patience being baffled and prostrated by a fierce and lasting Paroxysm of the Gout, or Stone, or Cholick, and compelled to yield to its furious Insults, and confess itself vanquished, the Soul being unable to divert, or to do any thing else but pore upon the Pain. And, therefore, those Stoical Vaunts of their Wise Man's being happy in Perillus's Bull, I utterly reject and explode, as vain Rhodomontades, and chimerical Figments; for that there never was such a Wise Man among them, or indeed could be: Yet do I not say, that the Patience of a Good Man can be so far conquer'd by the sharpest and severest Torments, as to be compelled to deny or blaspheme God, or his Religion; yea, or so much as to complain of his Injustice, tho' perchance he may be brought with Job to curse his Day, yet not curse his God, as his Wife tempted him to do.

Now that the great AgOnothetes, and Brabeutes, the most just Judge and Rewarder; would be pleas'd so to qualifie and mitigate your Sufferings, as not to exceed the Measure of your Strength and Patience, or else arm you with such an high Degree of Christian Fortitude, as to be able to grapple with the most Extreme; and when You have finish'd Your Course in this World, grant You a placid and easy Passage out of it, and dignify You as one of His Victors, with a Crown of Eternal Glory and Felicity, is the Prayer of,

in all Service,

John Ray.

The
Preface

In all Ages wherein Learning hath flourished, complaint hath been made of the Itch of Writing, and the Multitude of worthless Books, wherewith importunate Scribblers have pester'd the world; Scribimus indocti doctique: And, - <latin>Tenet insanabile multos Scribendi Cacoethes</latin>. I am sensible that this Tractate may likely incur the Censure of a superfluous Piece, and myself the Blame of giving the Reader unnecessary Trouble, there having been so much so well written of this Subject, by the most learned Men of our time, Dr. Moore, Dr. Cudworth; Dr. Stillingfleet late Bishop of Worcester, Dr. Parker late of Oxon; and, to name no more, the Honourable Robert Boyle, Esq; so that it will need some Apology. First, Therefore, in Excuse of it, I plead, That there are in it some Considerations new and untouch'd by others: Wherein,

*p2
if I be mistaken, I alledge; Secondly, That the Manner of Delivery and Expression may be more suitable to some Mens Apprehension, and facile to their Understandings. If that will
not hold, I pretend, Thirdly, That all the Particulars contained in this Book, cannot be found in any one Piece known to me, but lie scattered and dispersed in many; and so this may serve to relieve those fastidious Readers that are not willing to take the Pains to search them out: And possibly, there may be some whose Ability (whatever their Industry might be) will not serve them to purchase, nor their Opportunity to borrow, those Books, who yet may spare Money enough to buy so inconsiderable a Trifle.

If none of these Excuses suffice to acquit me of Blame, and remove all Prejudice, I have two farther Reasons to offer, which I think will reach home, and justify this Undertaking:

First, That all Men who presume to write, at least, whose Writings the Printers will venture to publish, are of some Note in the World; and where they do, or have lived and conversed, have some Sphere of Friends and Acquaintance, that know and esteem them, who, it's likely, will buy any Book they shall write for the Author's Sake, who otherwise would have read none of that Subject, tho' ten times better; and so the Book; however inferior to what have been already published, may happen to do much Good.

Secondly, By Virtue of my Function, I suspect myself to be obliged to write something in Divinity, having written so much on other Subjects: For being not permitted to serve the Church with my Tongue in Preaching, I know not but it may be my Duty to serve it with my Hand by writing: And I have made Choice of this Subject, as thinking myself best qualified to treat of it. If what I have now written shall find so favourable Acceptance, as to encourage me to proceed, God granting Life and Health, the Reader may expect more: If otherwise, I must be content to be laid aside as useless, and satisfy myself in having made this Experiment.

As for this Discourse, I have been careful to admit nothing for Matter of Fact, or Experiment, but what is undoubtedly true, lest I should build upon a sandy and ruinous Foundation; and by the Admixture of what is false, render that Which is true suspicious.

I might have added many more Particulars; nay, my Text warrants me to run over all the visible Works of God in particular, and to trace the Footsteps of His Wisdom in the Composition, Order, Harmony, and Uses of every one of them, as well as of those that I have selected. But, First, This would be a Task far transcending my Skill and Abilities; nay, the joint Skill and Endeavours of all Men now living or that shall live after a thousand Ages, should the World last so long. For no Man can find out the Work that God maketh from the Beginning to the End, Eccles. iii. 11. Secondly, I was willing to consult the Infirmity of the Reader, or indeed of Mankind in general; which, after a short Confinement to one Sort of Dish, is apt to loath it, tho' never so wholesome, and which at first was most pleasant and acceptable: And so to moderate my Discourse, as to make an End of Writing, before I might presume he should be quite tired with reading.

I shall now add a Word or two concerning the Usefulness of the Argument or Matter of this Discourse, and the reason I had to make choice of it, besides what I have already offered.

First, the Belief of a Deity being the Foundation of all Religion, (Religion. being nothing but a devout Worshipping of God, or an Inclination of Mind to serve and worship Him) for he that cometh to God, must believe that he is, it is a Matter of the highest concernment, to be firmly settled and established in a full Persuasion of this main Point: Now this must be demonstrated by Arguments drawn from the Light of Nature, and Works of the Creation: For as all other Sciences, so Divinity proves not, but supposes its Subjects, taking it for granted that by Natural Light, Men are sufficiently convinced of the Being of a Deity. There
are indeed supernatural Demonstrations of this fundamental Truth, but not common to all Persons or Times, and so liable to Cavil and Exception by Atheistical Persons, as inward Illuminations of Mind, a Spirit of Prophecy and Foretelling future Contingents, illustrious Miracles, and the like. But these Proofs taken from Effects, and Operations, exposed to every Man's view, not to be denied or questioned by any, are most effectual to convince. all that deny or doubt of it. Neither are they only convictive of the greatest and subtlest Adversaries, but intelligible also to the meanest Capacities: For you may hear illiterate Persons of the lowest Rank of the Commonalty affirming, That they need no Proof of the

*6

Being of a God, for that every Pile of Grass, or Ear of Corn, sufficiently proves that: For, say they, all the Men of the World cannot make such a thing as one of these; and if they cannot do it, who can, or did make it but God? To tell them, that it made itself, or sprung up by Chance, would be as ridiculous as to tell the greatest Philosopher so.

Secondly, the Particulars of this Discourse serve not only to demonstrate the Being of a Deity, but also to illustrate some of his principal attributes; namely, his infinite Power and Wisdom. The vast Multitude of Creatures, and those not only small, but immensely great, the Sun and Moon, and all the Heavenly Host, are Effects and Proofs of His Almighty Power. The Heavens declare the Glory of God, and the Firmament sheweth His Handy-Work, Psal. xix. 1. The admirable Contrivance of all and each of them, the Adapting all the Parts of Animals to their several Uses, the Provision that is made for their Sustenance, which is often taken Notice of in Scripture, Psal. cxxv. 15, 16. The Eyes of all wait upon Thee: Thou givest them their Meat in due Season. Thou openest Thy Hand, and satisfieft the Defire of every living Thing. Matth. vi. 26. Behold the Fowls of the Air, for they sow not, neither do they reap nor gather into Barns yet your Heavenly Father feedeth them. Psal. cxlvii. 9. He giveth to the Beast his Food, and to the young ravens when they cry. And, Lastly, Their mutual Subserviency to each other, and

*7

unanimous conspiring to promote and carry on the Publick Good, are evident Demonstrations of His Sovereign Wisdom.

Lastly, They serve to stir up and increase in us the Affections and Habits of Admiration, Humility, and Gratitude. Psal. viii. 3. When I considered the Heavens, the Work of Thy Fingers, the Moon and the Stars which Thou hast ordained: What is Man that Thou art mindful of him, or the Son of Man that Thou visitest him? And to these Purposes the Holy Psalmist is very frequent in the Enumeration and Consideration of these Works, which may warrant me doing the like, and justify the denominating such a Discourse as this, rather Theologicnl than Philosophical.

[Note, That by the Works of the Creation, in the Title, I mean the Works created by God at first, and by Him conserv’d to this Day in the same State and Condition in which they were at first made; for Conservation (according to the Judgment both of Philosophers and Divines) is a continued Creation.]
Psalm. CIV. 24. *How manifold are thy works, O Lord!* In Wisdom hast thou made them all.

In these Words are two Clauses, in the first whereof the Psalmist admires the Multitude of God's Works, *How manifold are thy Works, O Lord?* In the second he celebrates his Wisdom in the Creation of them; *In Wisdom hast thou made them all.*

*18* Of the first of these I shall say little, only briefly run over the Works of this visible World, and give some guess at the Number of them; whence it will appear, that upon this account they will deserve Admiration, the Number of them being uninvestigable by us; and so affording us a demonstrative Proof of the unlimited Extent of the Creator's Skill, and the fecundity of his Wisdom and Power. That the number of corporeal Creatures is unmeasurably great, and known only to the Creator himself; may thus probably be collected: First of all, the Number of fix'd Stars is on all hands acknowledg'd to be next to infinite: Secondly, Every fix'd Star, in the now-receiv'd *Hypothesis*, is a Sun or Sun-like Body, and in like manner encircled with a *Chorus* of Planets moving about it; for the fix'd Stars are not all placed in one and the same concave Spherical *Superficies*, and equidistant from us, as they seem to be, but are variously and disorderly situate, some nearer, some further off, just like Trees in a Wood or Forest; as *Gassendus* exemplifies them. And as in a Wood, tho' the Trees grow never so irregularly, yet the Eye of the Spectator, wherever plac'd, or whithersoever remov'd, describes still a circle of Trees: So would it in like manner wherever it were in the Forest of Stars, describe a Spherical *Superficies* about it. Thirdly, each of these Planets is in all likelihood furnished with as great Variety of corporeal Creatures, animate and inanimate, as the earth is, and all as different

*19* in Nature as they are in Place from the Terrestrial, and from each other. Whence it will follow, that these must be much more infinite than the Stars: I do not mean absolutely according to Philosophick Exactness infinite, but only infinite or innumerable as to us, or their Number prodigiously great.

That the fix'd Stars are innumerable, may thus be made out: Those visible to the naked Eye are by the least Account acknowledg'd to be above a Thousand, excluding those towards the south Pole, which are not visible in our Horizon: Besides these, there have been incomparably more detected and brought to light by the Telescope; the Milky-way being found out to be; (as was formerly conjectr'd) nothing but great Companies or Swarms of Minute Stars singly invisible, but by reason of their Proximity mingling and confounding their Lights, and appearing like lucid Clouds. And it's likely that, had we more perfect Telescopes many Thousands more might be discovered; and yet after all, an incredible Multitude remain, by reason of their immense Distance beyond all Ken by the best Telescopes that could possibly be invented or polish'd by the Wit and Hand of an Angel: For if the World be (as Des Cartes would have it) indefinitely extended; that is, so far as no human Intellect can fansie any Bounds of it; then what we see, or can come to see, must be the least Part of what is undiscoverable by us, the whole Universe extending a thousand times further beyond the

*20* utmost Stars we can possibly descry, than those be distant from the Earth we live upon. This Hypothesis of the fix'd stars being so many Suns, &c. seems more agreeable to the Divine Greatness and Magnificence. But that which induces me much to doubt of the Magnitude of the Universe, and immense Distance of the fix’d Stars, is the stupendous *Phoenomena* of
Comets, their sudden Accension or Appearance in full Magnitude, the Length of their Tails and Swiftness of their Motion, and gradual Diminution of Bulk and Motion, 'till at last they disappear. That the Universe is indefinitely extended, Des Cartes, upon a false ground, [that the formal Ratio of a Body was nothing but Extension into Length, Breath and Proximity, or having partes extra partes, and that Body and Space were synonymous Terms] asserted; it may as well be limited this Way, as in the old Hypothesis, which places the fix'd Stars in the same spherical Superficies; according to which (old Hypothesis) they may also be demonstrated by the same Mediums to be innumerable, only instead of their Distance substituting their Smallness for the Reason of their Invisiblility.

But leaving the Celestial Bodies, I come now to the Terrestrial; which are either inanimate or animate. The inanimate are the Elements, Meteors and Fossils, of all Sorts, at the Number of which last I cannot give any probable Guess: But if the Rule which some considerate Philosophers deliver, holds good, viz.

*21 how much more imperfect any Genus or Order of Beings is, so much more numerous are the Species contain'd under it: As for Example Birds being a more perfect Kind of Animal than Fishes, there are more of these than of those; and for the like Reason more Birds than Quadrupeds, and more Insects than of any of the rest, and so more Plants than Animals, Nature being more sparing in her more excellent Productions. If this Rule, I say, hold good, then should there be more Species of Fossils, or generally of inanimate Bodies, than of Vegetables, of which there is some Reason to doubt, unless we will admit all Sorts of formed Stones to be distinct Species.

Animate Bodies are divided into four great Genera or Orders, Beasts, Birds, Fishes and Insects.

The Species of Beasts, including also Serpents, are not very numerous: Of such as are certainly known and describ'd, I dare say not above 150; and yet I believe not many, that are of any considerable Bigness, in the known Regions of the World, have escap'd the Cognizance of the Curious. [I reckon all dogs to be of one Species, they mingling together in Generation, and the Breed of such Mixtures being prolifick.]

The Number of Birds known and describ'd may be near 500; and the Number of Fishes, excluding Shell-Fish, as many: But if the Shell-Fish be taken in, more than six times the Number. How many of each Genus remain yet undiscover'd, one cannot certainly nor very nearly

*22 conjecture; but we may suppose the whole Sum of Beasts and Birds to exceed by a third part, and Fishes by one Half; those known.

The Insects, if we take in the Exanguious both Terrestrial and Aquatick, may, in Derogation to the precedent Rule, for Number, vie even with Plants themselves: For the Exanguious alone, by what that Learned and Critical Naturalist, my honour'd Friend, Dr. Martin Lister, hath already observ'd and delineated, I conjecture, cannot be fewer than 3000 Species, perhaps many more.

The Butterflies and Beetles are such numerous Tribes, that I believe in our own native Country alone the Species of each Kind may amount to 150 or more. And if we should make the Catterpillers and Hexapods, from whence these come, to be distinct Species, as most
Naturalists have done, the Number will be doubled, and these two Genera will afford us 600 Species: But if those be admitted for distinct Species, I see no Reason but their *Aureliae* also may pretend to a specifick Difference from the Caterpillers and Butterflies, and so we shall have 300 Species more; therefore we exclude both these from the Degree of Species, making them to be the same Insect under a different *Larva* or Habit.

The Fly-kind, if under that Name we comprehend all other flying Insects, as well such as have four, as such as have but two Wings, of both which Kinds there are many subordinate *Genera*, will be found in Multitude of Species,

*23* to equal, if not exceed, both the foremention'd Kinds.

The creeping Insects that never come to be wing'd, tho' for Number they may fall Short of the flying or winged, yet are they also very numerous; as by running over the several Kinds I could easily demonstrate. Supposing then there be a Thousand several Sorts of Insects in this Island and the Sea near it, if the same Proportion holds between the Insects native of England, and those of the rest of the World, as doth between Plants domestick and exotick, (that is, as I guess, near a Decuple) the Species of Insects in the whole Earth (Land and Water) - will amount to 10000, and I do believe they rather exceed than fall short of that Sum.

Since the Writing hereof, having this summer, Ann. 1691. with some diiligence prosecuted the History of our English Insects, and making Collections of the Several Species of each Tribe, but particularly and especially of the Butterflies, both nocturnal and diurnal, I find the Number of such of these alone as breed [about Braintree and Notely in Essex] to exceed the Sum I last Year assign'd to all England, having myself observ'd and describ'd about 200 Kinds great and small, many yet remaining, as I have good Reason to believe, by me undiscover'd. This I have, since the writing hereof found true in Experience, having every Year observ'd not a few new Kinds: Nor do I think that, if I should live 20 Years longer, I should by my utmost Diligence and Industry in searching

*24* them out, come to an End of them. If then within the small Compass of a Mile or two there are so many Species to be found, surely the most modest Conjecsture cannot estimate the Number of all the Kinds of *Papilio's* native of this Island to fall short of 300, which is twice so many as I last Summer guess'd them to be; wherefore, using the same Argumentations, the Number of all the British Insects will amount to 2000 and the total Sum of those of the whole Earth will be 20000. The Number of Plants contain'd in *C. Bauhin's Penax* is about 6000, which are all that had been describ'd by the Authors that wrote before him, or observ'd by himself; in which Work, besides Mistakes and Repetitions incident to the most wary and knowing Men in such a Work as that, there are a great many, I might say some Hundreds, put down for different Species, the which in my Opinion are but accidental Varieties: Which I do not say to detract from the excellent Pains and Performance of that Learned, Judicious and Laborious Herbarist, or to defraud him of his deserv'd Honour, but only to shew that he was too much sway'd by the Opinions then generally current among Herbarists, that different Colour or multiplicity of leaves in the flower and the like Accidents, were sufficient to constitute a specifick difference. But supposing there had been 6000 then known and describ'd, I cannot think but that there are in the World more than triple that Number; there being in the vast Continent of *America* as great a Variety

*25*
of Species as with us, and yet but few common to Europe, or perhaps Africk and Asia. And if on the other Side the Equator, there be much Land still remaining undiscover'd, as probably there may, we must suppose the Number of plants to be far greater.

What can we infer from all this? If the Number of Creatures be so exceeding great, how great nay, immense must needs be the Power and Wisdom of him who form'd them all! For (that I may borrow the Words of a noble and excellent Author) as it argues and manifests more Skill by far in an Artificer, to be able to frame both Clock and Watches, and Pumps, and Mills and Granadoes, and Rockets, than he could display in making but one of those sorts of Engines; so the Almighty discovers more of his Wisdom in forming such a vast Multitude of different Sorts of Creatures, and all with admirable and irreprovable Art, than if he had created but a few; for this declares the Greatness and unbounded Capacity of his Understanding. Again, the same Superiority of Knowledge would be display'd, by contriving Engines of the same Kind, or for the same Purposes, after different Fashions, as the moving of Clocks or other Engines by Springs instead of Weights: So the infinitely Wise Creator hath shewn many Instances, that he is not confin'd to one only instrument for the working one Effect, but can perform the same thing by divers means. So, though feathers seem necessary for flying, yet hath he enabled several creatures to fly without them,

*26

as two Sorts of Fishes, one Sort of Lizard, and the Bat, not to mention the numerous Tribes of flying Insects. In like manner, though the Air bladder in Fishes seems necessary for swimming, yet some are so form'd as to swim without it; viz. First, the Cartilagineous Kind, which by what Artifice they poise themselves, ascend and descend at pleasure, and continue in what Depth of Water they list, is as yet unknown to us. Secondly, the Cetaceous Kind, or Sea-Beasts, differing in nothing almost from Quadrupeds but the want of Feet. The Air which in Respiration these receive into their Lungs, may Serve to render their Bodies equiponderant to the Water; and the Constriction or Dilatation of it, by the help of the Diaphragm and Muscles of Respiration, may probably assist them to ascend or descend in the Water, by a light Impulse thereof with their Fins.

Again, though the Water being a cold Element, the most Wise God hath so attemper'ed the blood and Bodies of Fishes in general, that a small degree of heat is sufficient to preserve their due Consistency and Motion, and to maintain Life; yet to shew that he can preserve a Creature in the Sea, and in the coldest Part of the Sea too, that may have as great a degree of heat as Quadrupeds themselves, he hath Created great variety of these Cetaceous fishes, which converse chiefly in the Northern Seas, whose whole Body being encompassed round with a copious Fat or Blubber (which by reflecting and redoubling the internal heat, and keeping off the external

*27

Cold, doth the same Thing to them that Clothes do to us) is enabled to abide the greatest Cold of the Sea-Water. The reason why these fishes delight to frequent chiefly the Northern Seas, is, I conceive, not only for the Quiet which they enjoy there, but because the Northern Air which they breathe being more fully charg'd with those particles suppos'd nitrous, which are the Aliment of Fire, is fittest to maintain the vital Heat in that Activity which is sufficient to move such an unwieldy bulk, as their bodies are, with due Celerity, and to bear up against and repel the ambient Cold; and may likewise enable them to continue longer under Water than a warmer and thinner Air could.
Another instance to prove that God can, and doth by different Means produce the same Effect, is the various Ways of extracting the nutritious Juice out of the Aliment, in several Kinds of Creatures.

I. In Man and viviparous quadrupeds the Food moisten'd with the Spittle [saliva] is first chew’d and prepar’d in the Mouth, then swallow’d into the Stomach, where being mingled with some dissolvent Juices, it is by the Heat hereof concocted, macerated, and reduc’d into a Chyle or Cremor, and so evacuated into the Intestines, where being mix’d with the Choler and Pancreatrick Juice, it is further subtiliz’d and render’d so fluid and penetrant, that the thinner and finer Part of it easily finds its Way in at the streight Orifices of the lacteous Veins.

*28

1. In Birds there is no Mastication or Comminution of the Meat in the Mouth; but in such as are not Carnivorous, it is immediately swallow’d into the Crop or Craw, or at least into a Kind of Antestomach (which I have observ’d in many, especially Piscivorous Birds) where it is moistned and mollified by some proper Juice from the Glandules distilling in there, and thence transferr’d into the Gizzard or Muscular Stomach, where by the working of the Muscles compounding the Sides of that Ventrie, and by the Assistance of small Pebbles (which the Creature swallows for that Purpose) it is, as it were, by Mill-stones ground small, and so transmitted to the Guts, to be further attenuated and subtiliz’d by the foremention’d Choler and Pancreatrick Juice.

3. In oviparous Quadrupeds, as Chamaelions, Lizards, Frogs, as also in all Sorts of Serpents, there is no Mastication or Comminution of the Meat, either in Mouth or Stomachs; but as they swallow Insects or other animals whole, so they avoid their Skins unbroken, having a Heat, or Spirits, powerful enough to extract the Juice they have Need of, without breaking that which contains it; as the Parisian Academist tells us. I myself cannot warrant the Truth of the Observation in all. Here, by the by, we take Notice of the wonderful Dilatability or extendableness of the Throats and Gullets of Serpents: I myself have taken two entire adult Mice out of the Stomach of an Adder, whose Neck was not bigger than my little Finger. These Creatures, I say, draw out the juice of what they swallow without any comminution, or so much as breaking the Skin; even as it is seen that the juice of grapes is drawn as well from the Rape (Whole grapes pluck’d from the Cluster, and Wine poured upon them in a Vessel), where they remain whole, as from a Vat, where they are bruised; to borrow the Parisian Philosophers Similitude.

*29

4. Fishes, which neither chew their Meat their Mouths nor grind it in their Stomachs, do by the Help of a dissolvent Liquor, therey Nature provided, corrode and reduce it, Skin, Bones and all, into a Chylus or Cremor; and yet (which may seem wonderful) this Liquor manifests nothing of Acidity to the Tast: But not withstanding, how mild and gentle soever it seems to be, it corrodes Flesh very strangely and gradually, as Aqua fortis or the like corrosive Waters do Metals, as appears to the Eye; for I have observ’d Fish in the Stomachs of others thus partially corroded, first the superficial Part of the Flesh, and then deeper and deeper by degrees to the Bones.

I come now to the second part of the words; In Wisdom hast thou made them all. In discoursing whereof I shall endeavour to make out in particulars what the Psalmist here asserts in general concerning the Works of God, that they are all very wisely contriv’d and adapted to Ends both particular and general.
But before I enter upon this Task, I shall, by way of Preface or Introduction, say something concerning those Systems which undertake to

*30 give an Account of the Formation of the Universe by Mechanical Hypotheses of Matter, mov'd either uncertainly, or, according to some Catholick Laws, without the intervention and assistance of any superior immaterial Agent.

There is no greater; at least no more palpable and convincing Argument of the Existence of a Deity, than the admirable Art and Wisdom that discovers itself in the Make and Constitution, the Order and Disposition, the Ends and Uses of all the Parts and Members of this stately Fabrick of Heaven and Earth: For if in the Works of Art, as for Example, a curious Edifice or Machine, Counsel, Design, and Direction to an End appearing in the whole Frame, and in all the several pieces of it, do necessarily infer the Being and Operation of some intelligent Architect or Engineer, why shall not also in the Works of Nature, that (grandeur and Magnificence, that excellent Contrivance for Beauty, Order, Use, &c. which is observable in them, wherein they do as much transcend the Effects of humane Art as infinite Power and Wisdom exceeds finite, infer the Existence and Efficiency of an Omnipotent and All-Wise Creator?

To evade the force of this Argument, and to give some Account of the Original of the World, Atheistical Persons have set up two Hypotheses.

The first is that of Aristotle, that the World was from Eternity in the same Condition that now it is, having run through the Successions of infinite Generations; to which they add,

*31 self-existent and unproduced: For Aristotle doth not deny God to be the efficient Cause of the World; but only asserts, that he created it from Eternity, making him a necessary Cause thereof; it proceeding from him by way of Emanation, as Light from the Sun.

This Hypothesis, which hath some Shew of Reason, for something must necessarily exist of itself; and if something, why may not all Things? This Hypothesis, I say, is so clearly and fully confuted by the Reverend and Learned Dr. Tillotson, late Lord Archbishops of Canterbury, and Primate of all England, in his first Printed Sermon, and the Right Reverend Father in God, John, late Lord Bishop of Chester. in Book I. Chap. V. of his Treatise of the Principles of Natural Religion, that nothing material can by me be added: To whom therefore I refer the Reader.

The Epicurean Hypothesis rejected

The Second Hypothesis is that of the Epicureans, who held, that there were two Principles self-existent. First, Space or Vacuity; Secondly, Matter or Body; both of infinite Duration and Extension. In this infinite Space or Vacuity, which hath neither Beginning, no End, nor Middle; no Limits or Extreams, in numerable minute Bodies, into Which the Matter was divided, call'd Atoms, because by Reason of their perfect Solitude they were really indivisible (for they hold no Body capable of

*32 Division, but what hath Vacuities interspers'd with Matter, of various but a determinate Number of Figures, and equally ponderous, do perpendicularly descend, and by their
fortuitous Concourse make compound Bodies and at last the World itself. But now, because if all these Atoms should descend plum down with equal Velocity, as according to their Doctrine they ought to do, being (as we said) all perfectly solid and imporous, and the vacuum not resisting their Motion, they would never the one overtake the other, but like the Drops of a Shower would always keep the same Distances, and so there could be no Concourse or Cohesion of them, and consequently nothing created; partly to avoid this destructive Consequence, and partly to give some Account of the Freedom of Will (which they did assert contrary to the Democratick Fate) they did absurdly feign a Declination of some of these principles, without any shadow or pretence of Reason. The former of these motives you have set down by Lucretius, <margin>de Nat. rerum, 1. 2. </margin> in these Words:

\[
\text{Corpora cum deorsum rectum per inane feruntur.}
\]

\[
Ponderibus propriis, incerto tempore fortè,
\]

\[
\text{Incertiq; locis, Spatio discedere paulùm;}

\[
\text{Tantum quod momen mutatum dicere possis.}
\]

And again;  

\[
\text{Quod nisi declinare solerent, omnia deorsum}
\]

\[
\text{Imbris uti gutae caderent per inane profundum,}
\]

\[
\text{Nec foret offensus natus, nec plaga creata}
\]

\[
\text{Principiis, ita nil umquam natura creâsset.}
\]

\*33

Now Seeds in downward Motion must decline,  
Th' vary little from the exactest Line;  
For did they still move strait, they needs must fall  
Like Drops of Rain, dissolv'd and scatter'd all,  
For ever tumbling thro' the mighty Space,  
And never join to make one single Mass.

The Second Motive they had to introduce this gratuitous Declination of Atoms, the same Poet gives us in these Verses, Lib. 2.

\[
\text{Si semper motus connectitur omnis,}
\]

\[
\text{Et vetere exoritur semper novus ordine certo,}
\]

\[
\text{Nec declinando faciunt primordia mot&ucirc;c;}
\]

\[
\text{Principium quoddam quod fati foedera rumpat,}
\]

\[
\text{Ex iiinito ne caufazn caufa fequatur;}
\]

\[
\text{Libera per terras unde haec animantibus extat,}
\]

\[
\text{Unde haec est, inquam, fatis avolsa voluntas ?}
\]

Besides, did all things move in direct Line,  
And still one Motion to another join  
In certain Order, and no Seeds decline,  
And make a Motion fit to dissipate  
The well-wrought Chain of Causes and strong Fate;  
Whence comes that Freedom living Creatures find ?  
Whence comes the Will so free, so unconfin'd,  
Above the Power of the Fate?
The Folly and Unreasonableness of this ridiculous and ungrounded Figment, I cannot better display and reprove than in the Words of Cicero, in the Beginning of his first Book de finibus Bonorum et Malorum. This Declination (saith he) is altogether childishly feign'd, and yet neither doth it at all solve the Difficulty, or effect what they desire: For First they say the Atoms decline, and yet assign no Reason why. Now nothing is more shameful and unworthy a Natural Philosopher (turpis Physico) than to assert anything to be done without a Cause, or to give no Reason of it. Besides, this is contradictory to their own Hypothesis taken from sense, that all Weights do naturally move perpendicularly downward.

Secondly, again supposing this were true, and that there were such a Declination of Atoms, yet will it not effect what they intend. For either they do all decline, and so there will be no more Concourse than if they did perpendicularly descend; or some decline, and some fall plum down, which is ridiculously to assign distinct Offices and Tasks to the Atoms which are all of the same Nature and Solidity.

Again, in his book de Fato he smartly derides this fond Conceit thus; What Cause is there in nature which turns the Atoms aside? Or do they cast Lots among themselves which shall decline, which not? Or why do they decline the least Interval that may be, and not a greater? Why not two or three minima as well as one; Optare hoc quidem est non disputare. For neither is the Atom by any extrinsical Impulse diverted from its natural Course; neither can there be any Cause imagin'd in the Vacuity through which it is carried, why it should not move directly; neither is there any Change made in the Atom itself, that it should not retain the Motion natural to it, by Force of its Weight or Gravity.

As for the whole Atomical Hypothesis, either Epicurean or Democritick, I shall not, nor need I, spend time to confute it; this having been already solidly and sufficiently done by many learned Men, but especially Dr. Cudworth, in his Intellectual System of the Universe, and the late Bishop of Worcester, Dr. Stillingfleet, in his Origines Sacrae. Only I cannot omit the Ciceronian confutation thereof, which I find in the place first quoted, and in his first and second Books de Natura Deorum, because it may serve as a general Introduction to the following Particulars.

Such a turbulent Concourse of Atom could never, (saith he) hunc mundi ornatum efficere, compose so well-order'd and beautiful a Structure as the World is; which therefore both in Greek and Latin hath from thence [ab ornatu et munditie] obtain'd its Name. And again most fully and appositely in his second De Nat Deorum: If the works of Nature are better, more exact and perfect than the Works of Art, and Art effects nothing without Reason, neither can the Works of Nature be thought to be effected without Reason. For is it not absurd and incongruous that when thou beholdest a Statue or curious Picture, thou shouldest acknowledge that Art was usd to the making of it; or when thou seest the course of a Ship upon the Waters, thou

shouldst not doubt but the Motion of it is regulated and directed by Reason and Art; or when thou considerest a Sun-Dial or Clock, thou shouldest understand presently, that the Hours are shewn by Art, and not by Chance; and yet imagine or believe, that the World, which comprehends all these Arts and Artificers, was made without Counsel or Reason. If one

*34

*35

*36
should carry into Scythia or Britain such a Sphere as our Friend Posidonius lately made,
each of whose Conversions did the same Thing in the Sun and Moon and other five Planets,
which we see affected every Night and Day in the Heavens, who among those Barbarians
would doubt that that Sphere was compos'd by Reason and Art? A Wonder then it must
needs be, that there should be any Man found so stupid and forsaken of Reason, as to
persuade himself; that this most beautiful and adorn'd World was or could be produc'd by
the fortuitous concourse of Atoms. He that can prevail with himself to believe this, I do not
see why he may not as well admit, that if there were made innumerable Figures of the one
and twenty Letters, in Gold, suppose, or any other Metal, and there well shaken and mixt
together, and thrown down from some high Place to the Ground, they when they lightted
upon the Earth would be so dispos'd and yank'd that a Man might see and read in them
Ennius's Annals; whereas it were a great Chance if he should find one Verse thereof among
them all. For if this concourse of Atoms could make a whole World, why may it not
sometimes make,

*37

and why hath it not somewhere or other in the Earth made, a Temple, or a Gallery, or a
Portico, or a House, or a City? Which yet is so far from doing, and every Man so far from
believing, that should anyone of us be cast, suppose, upon a desolate island, and find there a
magnificent Palace, artificially contriv'd according to the exact Rules of Architecture, and
curiously adorn'd and furnish'd, it would never once enter into his Head, that this was done
by an Earthquake, or the fortuitous Shuffling together of its component Materials; or that it
had stood there ever since the Construction of the World, or first Cohaeasion of Atoms; but
would presently conclude that there had been some intelligent Architect there, the Effect of
whose Art and Skill it was. Or should he find there but upon one single Sheet of Parchment
or Paper, an Epistle or Ora tion written, full of profound Sense, expressed in proper and
significant Words, illusrated and adorn'd with elegant Phrase; it were beyond the Possibility
of the Wit of Man to persuade him that this was done by the temerarious Dashes of an
unguided Pen, or by the rude Scattering of Ink upon the Paper, or by the lucky Projection of
so many Letters at all Adventures; but he would be convinc'd by the Evidence of the Thing
at first Sight, that there had been not only some Man, but some Scholar there.

The Cartesian hypothesis consider'd and censur'd

Having rejected this Atheistick Hypothesis of

*38

Epicurus and Democritus, I should now proceed to give particular Instances of the Art and
Wisdom clearly appearing in the several Parts and Members of the Universe; from which we
may justly infer this general Conclusion of the Psalmist, *In Wisdom hast thou made them all:* But that there is a Sort of professed Theists, I mean, Mons. Des Cartes and his Followers,
who endeavour to disarm us of this decreryory Weapon, to evacuate and exterminate this
Argument, which hath been so successful in all Ages to demonstrate the Existence, and
enforce the Belief of a Deity, and to convince and silence all Atheistick Gainsayers. And
this they do,

First, By excluding and banishing all Consideration of final Causes from Natural
Philosophy, upon Pretence, that they are all and every one in particular undiscoverable by
us; and that it is Rashness and Arrogance in us to think we can find out God's Ends, and be
Partakers of his Counsels.
Atque ob hanc uniam rationem totum illud causarum genus quod &agrave;e fine peti folet, in rebus Physicis nullum usum habere existimo; non enim absq: temeritate me puto investigare posse fines Dei. Medit. Metaph.

And for this only Reason, I think, all that Kind of Causes which is wont to be taken from the End, to have no use in Physicks or natural Matters; for I cannot without rashness think myself able to find out the Ends of God.

And again in his Principles of Philosophy;
Nullas unquam rationes circa res Naturales &agrave;e fine quem Deus aut Natura in iis faciendis fibi proposuit admittiimus, quia non tantum nobis

*39
debemus arrogare ut ejus Conciliorum participes esse possimus.

We can by no Means admit any Reasons about natural Things, taken from the End which God or Nature propos'd to themselves in making of them; because we ought not to arrogate so much to ourselves, as to think we may be Partakers of his Counsels.

And more expressly in his fourth Answer, viz. to Gassendus’s Objections;

Nec fingi potest, aliquos Dei fines magis quàm alios in propatulo esse: omnes enim in imperscrutabili ejus Sapientiae abyssi sunt eodem modo reconditi:

That is, Neither can nor ought we to feign or imagine that some of God's Ends are more manifest than others; for all lie in like Manner or equally hidden in the unsearchable abyss of his Wisdom.

This confident Assertion of Des Cartes is fully examined and reprov'd by that honourable and excellent Person, Mr. Boyle, in his Disquisition about the final Causes of Natural Things, Sect. 1 from Page 10 to the end; and therefore I shall not need say much to it, only in brief this, that it seems to me false and of evil Consequence, as being derogatory from the Glory of God, and destructive of the Acknowledgment and Belief of a Deity:

For first, Seeing (for Instance) that the Eye is employ'd by Man and all Animals for the Use of Vision, which, as they are fram'd, is necessary for them, that they could not live without it; and God Almighty knew that would be so; and seeing it is so admirably fitted and adapted to this Use, that all the Wit and

*40
Art of Men and Angels could not have contriv'd it better, if so well, it must needs be highly absurd and unreasonable to affirm, either that it was not Design'd at all for this Use, or that it is impossible for Man to know whether it was or not.

Secondly, How can Man give Thanks and Praise to God for the Use of his Limbs and Senses, and those his good Creatures which serve for his Sustenance, when he cannot be sure they were made in any respect for him; nay, when 'tis as likely they were not, and that he doth but abuse them to serve Ends for which they were never intended.

Thirdly, This Opinion, as I hinted before, supercedes and cassates the best Medium we have to demonstrate the Being of a Deity, leaving us no other demonstrative Proof but that taken from the innate Idea; which, if it be a Demonstration, is but an obscure one, not satisfying
many of the Learned themselves, and being too subtle and metaphysical to be apprehended by vulgar Capacities, and consequently of no Force to persuade and convince them.

Secondly, They endeavour to evacuate and disannul our great Argument, by pretending to solve all the Phenomena of Nature, and to give an Account of the Production and Efformation of the Universe, and all the corporeal Beings therein, both celestial and terrestrial, as well animate as inanimate, not excluding Animals themselves, by a slight Hypothesis of Matter so and so divided and mov'd. The Hypothesis you

*41 have in Des Cartes's Principles of Philosophy, Part 2.

All the Matter of this visible World is by him suppos'd to have been at first divided by God into Parts nearly equal to each other, of a mean Size viz. about the Bigness of those whereof the Heavenly Bodies are now compounded; all together having as much Motion as is now found in the World and these to have been equally mov'd sevrally every one by itself about its own Centre, and among one another, so as to compose a fluid Body and also many of them jointly, or in Company about several other Points so far distant from one another, and in the same Manner dispos'd as the Centres of the fix'd Stars now are.

So that God has no more to do than to create the Matter, divide it into Parts, and put it into Motion, according to some few Laws, and that would of itself produce the World and all Creatures therein.

For a Conflagration of this Hypothesis, I might refer the Reader to Dr. Cudworth's System p.603, 604. but for his ease I will transcribe the words:

"God in the mean Time standing by as an idle Spectator of this Lusus Atomorum, this sportfull Dance of Atoms, and of the various Results thereof. Nay, these mechanick Theists have here quite outstripp'd and outdone the Atomick Atheists themselves, they being much more extravagant than ever those were; for the professed Atheists durst never venture to affirm, that this regular system of Things resulted from the fortuitous Motions of Atoms at the very First, before they had for a long Time together produced many other inept Combinations, or aggregate

*42 Forms of particular Things and nonsensical Systems of the whole; and they suppos'd also, that the Regularity of Things here in this World would not always continue such neither, but that some time or other, Confusion and Disorder will break in again. Moreover, that besides this World of ours, there are at this very instant innumerable other Worlds irregular, and that there is but one of a thousand or ten thousand among the infinite Worlds that have such Regularity in them, the Reason of all which is, Because it was generally taken for granted, and look'd upon as a common Notion, that twn apo tuKEs kai tou automatou aei houtw ginetai, as Aristotle expresseth it; none of those Things which are from Fortune or Chance come to pass always alike. But our mechanick Theists will have their Atoms never so much as once to have fumbled in these their Motions, nor to have produce'd any inept System, or incongruous forms at all, but from the very first all along to have taken up their Places, and ranged themselves so orderly, methodically and directly; as that they could not possibly have done it better had they been directed by the most perfect Wisdom. Wherefore these Atomick Theists utterly evacuate that grand Argument for a God taken from the Phaenomenon of the Artificial frame of things, which hath been so much insisted upon in all Ages, and which commonly makes the strongest impression of any other upon the minds of
Men &c the Atheists in the mean Time laughing in their sleeves, and not a little triumphing to see the cause

of Theism thus betray'd by its profess'd Friends and Assertors, and the grand Argument for the same totally slur'd by them, and so their work done, as it were, to their Hands.

Now as this argues the greatest Insensibility of Mind, or Sottishness and Stupidity in pretended Theists, not to take the least notice of the regular and artificial Frame of things, or of the Signature of the Divine Art and Wisdom in them, nor to look upon the Worlds and Things of Nature with any other Eyes than Oxen and Horses do; So there are there many Phaenomena in Nature, which being partly above the force of these mechanick powers, and partly contrary to the same, can therefore never be salv'd by them, nor without final Causes and some vital Principle: As for Example, that of Gravity or the Tendency of Bodie downward, the Motion of the Diaphragm in Respiration, the Systole and Diastole of the Heart, which is nothing but a Muscular Constriction and Relaxation, and therefore not mechanical but vital. We might also add, among many others, the Intersection of the Plains of Equator and Ecliptick, or the Earth's diurnal Motion upon an Axis not parallel to that of the Ecliptick, nor perpendicular to the Plain thereof. For tho' Des Cartes would needs imagine this Earth of ours once to have been a Sun, and so itself the Centre of a lesser Vortex, whose Axis was then directed after this Manner, and which therefore still kept the same Site or Posture, by Reason of the striate Particles finding no fit Pores or Traces for their Passages through it, but only in this Direction; yet does he himself confess, that because these two Motions of the Earth, the Annual and Diurnal, would be much more conveniently made upon parallel Axes, therefore, according to the Laws of Mechanism, they should be perpetually brought nearer and nearer together, till at length the Equator and Ecliptick come to have their axes parallel, which, as it hath not yet come to pass, so neither hath there been for these last Two Thousand Years (according to the best Observations and Judgments of Astronomers) any nearer approach made of them one to another. Wherefore the continuation of these two motions of the Earth, the Annual and Diurnal, upon Axes not parallel is resolvable into nothing but a final and mental Cause, or the <> to Beltizon, because it was best it should be so, the Variety of the Seasons of the Year depending thereupon. But the greatest of all the particular Phaenomena is the Formation and Organization of the Bodies of Animals, consisting of such Variety and Curiosity; that these mechanick Philosophers being no Way able to give an Account thereof from the necessarv motion of Matter, unguided by Mind for Ends, prudently therefore break off their System there when they should come to Animals, and so leave it altogether untouch'd. We acknowl'edg indeed there is a Posthumous piece extant, imputed to Cartes, and entitled, De la formation du Foetus, wherein there is some pretence made to salve all this fortuitous Mechanism. But as the Theory thereof is built wholly upon a false supposition,

sufficiently confuted by our Harvey his Book of Generation, that the Seed doth materially enter into the composition of the Egg: So is it all along precarious and exceptionable; nor doth it extend at all to the differencies that are in several Animals, nor offer the least Reason why an Animal of one Species might not be formed out of the Seed of another. Thus far the Doctor, with whom for the main I do consent.
I shall only add, that Natural Philosophers, when they endeavour to give an Account of any the Works of Nature by preconceiv’d Principles of their own, are for the most Part grossly mistaken and confuted by Experience; as [example of such error in simple matter of anatomy] obvious to Sense, and infinitely more easie to find out the Cause of, than to give an Account of the Formation of the World; that is, the Pulle the Heart, which he attributes to an Ebullition and sudden Expansion of the Blood in the Ventricles, after the Manner of Milk, which being heated to such a Degree, doth suddenly and as it were all at once, flush up and run over the Vessel. Whether this Ebullition be caus'd by a Nitro-Sulphureous ferment lodged especially in the left Ventricle of the Heart, which mingling with the Blood excites such an Ebullition, as we see made by the Mixture of some Chymical Liquors, viz . Oil of Vitriol, and deliquated Salt of Tartar; or by vital flame warming and boiling the Blood.

But this Conceit of his is contrary both to Reason and Experience: For, first, it is altogether unreasonable to imagine and affirm that the cool venal Blood should be heated to so high a Degree in so short a Time as the Interval of two Pulses which is less than the sixth part of a Minute. Secondly, in cold Animals, as for Example, Eels, the Heart will beat for many Hours after it is taken out of the Body, yea tho’ the Ventricle be opened and all the Blood squeezing’d out. Thirdly, the process of the Fibres which compound the Sides of the Ventricles running in Spiral Lines from the Tip to the Base of the Heart, some one Way, and some the contrary, do clearly shew that the Systole of the Heart is nothing but a Muscular constriction, as a Purse is shut by drawing the Strings contrary ways: Which is also confirm’d by Experience; for if the Vertex of the Heart be cut off, and a Finger thrust up into one of the Ventricles, in every Systole the Finger will be sensibly and manifestly pinch’d by the Sides of the Ventricle. But for a full Confutation of this Fancy, I refer the Reader to Dr. Lower's Treatise de Corde Chap. 2 and Des Cartes’s rules concerning the transferring of Motion from one Body in Motion to another in Motion or in Rest, are the most of them by Experience found to be false; as they affirm who have made Trial of them.

This Pulse of the Heart Dr. Cudworth would have to be no Mechanical but a Vital Motion, which to me seems probable, because it is not under the Command of the Will; nor are we conscious of any Power to cause or to restrain it, but it is carried on and continued without our knowledge or notice; neither can it be caused by the Impulse of any external Movent, unless it be Heat. But how can the Spirits agitated by Heat, unguided by a vital Principle, produce such a regular reciprocal motion? If that Site which the heart and its Fibres have in the Diastole be most natural to them, (as it seems to be) why doth it again contract itself, and not rest in that posture? If it be once contracted in a Systole by the Influx of the Spirits, why, the Spirits continually flowing in without let, doth it not always remain so? [for the Systole seems to resemble the forcible Bending of a Spring, and the Diastole its flying out again to its natural Site.] What is the Spring and principal Efficient of this Reciprocation? What directs and moderates the Motions of the Spirits? They being but stupid and senseless Matter, cannot of themselves continue any regular and constant Motion, without the Guidance and Regulation of some intelligen Being. You will say, what Agent is it which you would have to effect this? The Sensitive Soul it cannot be, because, that is indivisible, but the Heart, when separated wholly from the Body in some Animals, continues still to pulse for a considerable Time; nay, when it hath quite ceased, it may be brought to beat anew by the Application of warm Spittle, or by prickit gently with a Pin or Needle. I
answer, it may be in these Instances, the scattering Spirits remaining in the Heart, may for a
Time, being agitated by Heat, cause these faint Pulsations though I should rather attribute
them to a plastic Nature

*48
Nature or vital Principle, as the Vegetation of Plants must also be.

But, to proceed, neither can I wholly acquiesce in the Hypothesis of that Honourable and
deservedly famous Author I formerly had occasion to mention; which I find in his Free
Enquiry into the Vulgar Notion of Nature, p. 77, 78. delivered in these Words.

"I think it probable that the great and Wise Author of Things did, when he first formed the
Universal and Undistinguished Matter into the World, put its parts into various Motions,
whereby they were neccesarily divided into numberless Portions of differing Bulks, Figures
and Situations in respect of each other: And that by his infinite Wisdom and Power he did so
guide and over-rule the Motions of these Parts, at the beginning of things, as that (whether
in a shorter or a longer time Reason cannot determine) they were finally disposed into that
beautiful and orderly Frame that we call the World; among whose Parts some were so
curiously contriv'd, as to be fit to become the Seeds or seminal Principles of Plants and
Animals. And I further conceive, that he settled such Laws or Rules of local Motion among
the Parts of the universal matter, that by his ordinary and preserving Concourse, the several
Parts of the Universe thus once completed should be able to maintain the great Construction
or System and Oeconomy of the mundane Bodies, and propagate the Species of living
creatures. The same Hypothesis he

*49
repeats again pag. 124, 125 of the same Treatise.

This Hypothesis, I say, I cannot fully acquiesce in, because an intelligent Being seems me
requisite to execute the Laws of Motion. For first, Motion being a fluent Thing, and one
part of its Duration being absolutely independent upon another, it doth not follow that
because any thing moves this Moment, it must necessarily continue to do so the next; unless
it were actually possessse'd of its future Motion, which is a Contradiction; but it stands in as
much Need of an Efficient to preserve and continue its Motion as it did at first to produce it.
Secondly, Let Matter be divided into the subtilest Parts imaginable, and these be mov'd as
swiftly as you will, it is but a senseless and stupid Being still, and makes no nearer Approac
to Sense, Perception or vital Energy, than it had before; and do but only stop the internal
Motion of its Parts, and reduce them to Rest, the finest and most subtile Body that is, may
become as gross, and heavy, and stiff as Steel or Stone.

And as for any external Laws or established Rules of Motion, the stupid Matter is not
capable of observing or taking any Notice of them, but would be as sullen as the Mountain
was that Mahomet commanded to come down to him; neither can those Laws execute
themselves. Therefore there must, besides Matter and Law, be some Efficient, and that
either a Quality or Power inherent in the Matter itself,
which is hard to conceive, or some

*50
external intelligent Agent, either God himself immediately, or some Plastick Nature.

Happening lately to read The Christian Virtuoso, written by the same Author of the Enquiry
into the vulgar notions of Nature, (the illustrious Mr. Boyle) I find therein these Words:
"Nor will the Force of all that has been said for God's special Providence be eluded, by saying with some Deists, That after the first Formation of the Universe all Things were brought to pass by the settled Laws of Nature. For though this be confidently, and not without Colour, pretended, yet I confess it doth not satisfie me: For I look upon a Law as a Moral, not Physical Cause, as being indeed but a notional Thing, according to which an intelligent and free Agent is bound to regulate its Actions. But inanimate Bodies are utterly incapable of Understanding; what it is, or what it enjoins, or when they act conformably or unconformably to it: therefore the Actions of inanimate Bodies, which cannot incite or moderate their own Actions, are produced by real Power, not by Law."

All this being consonant to what I have here written, against what I took to be this Honourable Person's Hypothesis, I must needs, to do him Right, acknowledge myself mistaken; perceiving, now, that his Opinion was, that God Almighty did not only establish Laws and Rules of local motion among the Parts of the Universal Matter, but did, and does also himself, execute them, or move the Parts of Matter, according to them: So that we are in the main agreed, differing chiefly about the Agent that executes those Laws, which he holds to be God himself immediately, we a Plastick Nature; for the Reasons alledg'd by Dr. Cudworth, in his System, pag. 149. which are,;

*51*

First, Because the former, according to vulgar apprehension, would render the Divine Providence operose, solicitous and distractious; and thereby make the Belief of it entertain'd with greater Difficulty, and give Advantage to Atheists.

Secondly, it is not so decorous in Respect of God, that he should \(<\)autourgein hapanta, set his own Hand as it were to every work, and immediately do all the meanest and triflingst things himself drudgingly, without making use of any inferior or subordinate Ministers. These two Reasons are plausible, but not cogent; the two following are of greater Force.

Thirdly, the slow and gradual Process that is in the Generation of Things, which would seem to be a vain and idle Pomp or trifling formality, if the Agent were omnipotent.

Fourthly, those \(<\)hamartEmata, as Aristotle calls them, those Errors and Bungles which are committed when the Matter is inexact or contumacious, as in Monsters, &c. which argue the Agent not to be irresistible; and that Nature is such a Thing as is not altogether uncapable, as well as human Art, of being sometimes frustrated and disappointed by the Indisposition of the Matter; Whereas an omnipotent agent would always do its Work infallibly and irresistibly, no Ineptitude or Stubbornness of the Matter being ever able to hinder such an one, or make him bungle or fumble in any thing. So far the Doctor.

*52*

For my Part, I should make no Scruple to attribute the Formation of Plants, their Growth and Nutrition, to the vegetative Soul in them; and likewise the Formation of Animals to the vegetative Power of their Souls; but that the Segments and Cuttings of some Plants, nay, the very Chips and smallest Fragments of their Body, Branches or Roots, will grow and become perfect plants themselves, and so the vegetative Soul, if that were the Architect, would be divisible and consequently no spiritual or intelligent Being; which the plastick Principle must be, as we have shewn: For that must preside over the whole Oeconomy of the Plant, and be one single agent, which takes Care of the Bulk and Figure of the whole, and the
Situation, Figure, Texture of all the Parts, Root, Stalk, Branches, Leaves, Flowers, Fruit, and all their Vessels and juices. I therefore incline to Dr. Cudworth's Opinion, that God uses for these Effects the subordinate Ministry of some inferior Plastic Nature; as in his Works of Providence he doth of Angels. For the Description whereof I refer the Reader to his System.

Secondly, in particular I am difficult to believe, that the bodies of Animala can be form'd by matter divided and mov'd by what Laws you will or can imagine, without the immediate Presidency, Direction and Regulation of some intelligent Being. In the Generation or first Formation of, suppose, the Human Body out of

*53

(though not an Homogeneous Liquor, yet) a fluid Substance, the only material Agent or Mover is a moderate Heat. Now, how this, by producing an intestine Motion in the Particles of the Matter, which can be conceiv'd to differ in nothing else but Figure, Magnitude and Gravity, should by Vertue thereof, not only separate the Heterogeneous Parts, but assemble the Homogeneous into Masses or Systems, and that not each Kind into one Mass, but into many and disjoin'd ones, as it were so many Troops; and that in each Troop the particular Particles should take their Places, and cast themselves into such a Figure; as for Example, the Bones being about 300, are form'd of various sizes and shapes, so situate and connected, as to be subservient to many hundred Intentions and Uses, and many of them conspire to one and the same Action, and all this contrarily to the Laws of Specifick Gravity, in whatever Posture the body be formed; for the Bones, whose component Parts are the heavier, will be above some parts of the Flesh which are the lighter; how much more then, seeing it is form'd with the Head, (which for its Bigness is the heaviest of all the Parts) uppermost. This, I say, I cannot by any Means conceive. I might instance in all the Homogenous Parts of the Body, either Sites and Figures, and ask by what imaginable Laws of Motion their Bulk, Figure, Situation and Connection can be made out? What account can be given of the Valves, of the Veins and Arteries of the Heart, and of the Veins

*54

evertheless, and of their Situation; of the Figure and Consistency of all the Humours and Membranes of the Eye, all conspiring and exactly fitted to the use of Seeing; but I have touched upon that already, and shall discourse on it largely afterward. You will ask me, who or what is the Operator in the Formation of the Bodies of Man and other Animals? I answer, The sensitive Soul itself, if it be a spiritual and immaterial Substancce, as I am inclinable to believe: But if it be material, and consequently the whole Animal but a mere Machine or Automaton, as I can hardly admit, then must we have Recourse to a Plastic Nature.

That the Soul of Brutes is material, and the whole Animal, Soul and Body, but a mere Machine, is the Opinion, publickly own'd and declar'd, of DeS Cartes, Gassendus, Dr. Willis, and others. The same is also necessarily consequent upon the Doctrine of the Peripateticks, viz. that the sensitive soul is educed out of the power of the Matter, for nothing can be educed out of the Matter, but what was there before, which must be either Matter or some Modification of it. And therefore they cannot grant it to be a spiritual Substance, unless they will assert it to be educed out of nothing. This Opinion, I say, I can hardly digest. I should rather think Animals to be endued with a lower Degree of Reason, than that they are mere Machines. I could instance in many Actions of Brutes that are hardly to be accounted for without Reason and Argumentation; as that commonly

*55
noted of Dogs, that running before their Masters, they will stop at a Divarication of the way, till they see which Hand their Masters will take; and that when they have gotten a Prey, which they fear their Masters will take from them, they will run away and hide it, and afterwards turn to it. What account can be given why a Dog, being to leap upon a Table which he sees to be too high for him to reach at once, if a Stool Chair happens to stand near it, doth first mount up that, and from thence the Table? If he were a Machine or Piece of Clockwork, and this Motion caused by the striking of a Spring, there is no Reason imaginable why the Spring being set on Work, should not carry the machine in a right Line toward the Object that put it in Motion, as well when the Table is high as when it is low: Whereas I have often observ'd the first Leap the Creature hath taken up the Stool, not to be directly toward the Table, but in a Line oblique and much declining from the Object that mov'd it, or that part of the Table on which it Stood.

Many the like Actions there are, which I shall not spend Time to relate. Should this true, that Beasts were Automata or Machines, they could have no Sense or Perception of Pleasure or Pain, and consequently no Cruelty could be exercis'd towards them; which is contrary to the doleful Significations they make when beaten or tormented, and contrary to the common Sense of Mankind, all Men naturally pitying them, as apprehending them to have such Sense and Feeling of Pain and Misery as themselves have; whereas no Man is troubled to see a Plant torn, or cut, or stampt, or mangled how you please; and at last seemingly contrary to the Scripture too: For it is said, Proverbs 12 10 *A righteous Man regardeth the life of his Beast; but the tender Mercies of the Wicked are cruel.* The former Clause is usually English'd, *A good Man is merciful to his Beast; which is the true Exposition of it; as appears by the opposite Clause, that the Wicked are cruel,* What less then can be infer'd from this Place, than that Cruelty may be exercis'd towards Beasts, which, were they meer Machines, it could not be? To which I do not see what can be answer'd, but that the Scripture accommodates itself to the common, tho' false, Opinion of Mankind, who take these Animals to be endued with Sense of Pain, and think that Cruelty may be exercis'd towards them; tho' in Reality there is no such thing. Besides, having the same members and Organs of Sense as we have, it is very probable they have the same Sensations and Perceptions with us.

To this *Des Cartes* answers, or indeed saith, he hath nothing to Answer; but that if they think as well as we, they have an immortal Soul as well as we: Which is not at all likely, because there is no Reason to believe it of some Animals without believing it of all, whereas there are many too imperfect to believe it of them, such as are Oysters and Sponges, and the like. To which I answer, That there is no Necessity that they should be immortal,

because it is possible they may be destroyed or annihilated. But I shall not wade further into this Controversie, because it is beside my Scope, and there hath been as much written of it already as I have to say, by Dr. Moore, Dr. Cudworth, Des Cartes, Dr. Willis and others Pro and Con.

Of the visible works of God, and their Division.

I come now to take a View of the Works of the Creation, and to observe something of the Wisdom of Cicil discernible in the Formation of them, in their Order and Harmony, and in their Ends and Uses: And first I shall run them over slightly, remarking chiefly what is obvious and expos'd to the Eyes and Notice of the more careless and incurious Observer.
Secondly, I shall select one or two particular Pieces, and take a more exact Survey of them; though even in these, more will escape our Notice than can be discover'd by the most diligent Scrutiny: for our Eyes and Senses, however armed or assisted, are too gross to discern the curiosity of the workmanship of Nature, or those minute Parts by which it acts, and of which Bodies are compos'd; and our Understanding too dark and infirm to discover and comprehend all the Ends and Uses to which the infinitely wise Creator did design them.

But before I proceed, being put in Mind thereof by the Mention of the Assistance of our Eyes, I cannot omit one general Observation concerning the Curiosity of the Works of Nature

*58

in Comparison of the Works of Art which I shall propose in the late Bishop of Chester's Words, (Treatise of Natural Religion, Lib. I. C. 6.) "The Observations which have been made in these latter Times by the Help of the Microscope, since we had the Use and Improvement of it, discover a vast difference between Natural and Artificial Things. Whatever is natural, beheld thro' that, appears exquisitely form'd, and adorn'd with all imaginable Elegancy and Beauty. There are such inimitable Glidings in the smallest Seeds of Plants, but especially in the Parts of Animals in the Head or Eye of a small Fly; such Accuracy, Order and Symmetry in the Frame of the most minute Creatures, a Louse, for example, or a Mite, as no Man were able to conceive without seeing of them.

Whereas the most curious Works of Art, the sharpest and finest Needle, doth appear as a blunt rough Bar of Iron, coming from the Furnace or the Forge: The most accurate Engravings or Embellishments seem such rude, bungling and deform'd Work, as if they had been done with a Mattock or Trowel; so vast a Difference is there betwixt the Skill of Nature, and the Rudeness and Imperfection of Art. I might add, that the Works of Nature, the better Lights and Glasses you use, the more clearer and exactly form'd they appear; whereas the Effects of Human Art, the more curiously they are view'd and examin'd, the more of Deformity they discover.

*59

This being premised, for our more clear and distinct Proceeding in our cursory View of the Creation, I shall rank the Parts of this material and visible World under several Heads. Bodies are either inanimate or animate. Inanimate Bodies are either celestial or terrestrial. Celestial as the Sun, Moon and Stars: Terrestrial are either simple, as the four Elements, Fire, Water, Earth and Air; or mixt, either imperfectly, as the Meteors, or more perfectly, as Stones, Metals, Minerals, and the like. Animate Bodies are either such as are endued with a Vegetable Soul as Plants; or a Sensitive Soul, as the Bodies of Animals, Birds, Beasts, Fishes, and Insects; or a Rational Soul, as the Body of Man and the Vehicles of Angels, if any such there be.

I make use of this division to comply with the common and receiv'd Opinion, and for easier Comprehension and Memory; tho' I do not think it agreeable to Philosophick Verity and Accuracy, but do rather incline to the Atomick Hypothesis. For these Bodies we call elements are not only the only Ingredients of mix'd Bodies; neither are they absolutely simple themselves, as they do exist in the World, the Sea-water containing a copious Salt manifest to Sense; and both Sea and Fresh-water sufficing to nourish many Species of Fish, and consequently containing the various Parts of which their Bodies are compounded. And I believe there are many Species of Bodies which the Peripateticks call mix'd, which are as simple as the Elements themselves, as Metals, Salts and some sorts of
stones. I should therefore, with Dr. Grew and others, rather attribute the various Species of inanimate Bodies to the divers Figures of the minute Particles of which they are made up: And the Reason why there is a set and constant Number of them in the World, none destroy'd nor any new ones produc'd, I take to be, Because the Sum of the Figures of those minute Bodies into which Matter was at first divided, is determinate and fix'd.

2. Because those minute Parts are indivisible, not absolutely, but by any natural Force; so that there neither is nor can be more or fewer of them: For were they divisible into small and diversly figur'd parts by Fire or any other natural Agent, the Species of Nature must be confounded, some might be lost and destroy'd, but new ones would certainly be produc'd; unless we could suppose these new diminutive Particles should again assemble and marshal themselves into Corpuscles of such Figures as they compounded before; which I see no Possibility for them to do, without some theos apo mEkAnEs to direct them: Not that I think these inanimate Bodies to consist wholly of one Sort of Atoms, but that their Bulk consists mainly or chiefly of one Sort. But whereas it may be objected that Metals ( which of all others seem to be most simple ) may be transmitted one into another, and so the Species doth not depend upon the being compounded of Atoms of one Figure; I Answer, I am not fully satisfied of the Matter of Fact: But if any such Transmutation be, possibly all Metals may be of one

Species, and the Diversity may proceed from the Admixture of different Bodies with the Principle of the Metal. If it be ask'd, why may not atoms of different Species concur to the Composition of Bodies? and so, tho' there be but a few Sorts of original Principles, may there not be produced infinite Species of compound Bodies, as by the various Dispositions and Combinations of Twenty-four Letters innumerabl Words may be made up? I answer, because the Heterogeneous Atoms or Principles are not naturally apt to cohere and stick together when they are mingled in the same Liquor, as the Homooeneous readily do.

I do not believe that the Species of Principles or indivisible Particles are exceeding numerous but possibly the immediate component Particles of the Bodies of Plants and Animals may be themselves compounded.

Of the Heavenly Bodies.

Before I come to treat of the Heavenly Bodies in particular, I shall premise in general, that the whole Universe is divided into two Sorts of Bodies, the one very thin and fluid, the other more dense, solid and consistent. The thin and fluid is the Ether, comprehending the Air or Atmosphere encompassing the particular Stars and Planets. Now, for the Stability and Perpetuity of the whole Universe, Divine Wisdom and Providence hath given the solid and stable Parts a two-fold Power, one

of Gravity, and the other of Circular Motion. By the first they are preserv'd from Dissolution and Dissipation, which the Second would otherwise infer: For it being by the Consent of Philosophers, an innate Property of every Body moved circularly about any Centre to recede or endeavour to recede from that Centre of its Motion, and the more strongly the swifter it is mov'd, the Stars and Planets being whirl'd about with great Velocity, would suddenly, did nothing inhibit it, at least in a short Time be shatter'd in Pieces, and Scatter'd every Way through the Ether. But now their Gravity unites and binds them up fast, hindring the Dispersion of their Parts, I will not dispute what Gravity is; only I
will add, that, for ought I have heard or read, the Mechanical Philosophers have not as yet
given a clear and satisfactory Account of it.

The Second Thing is a Circular Motion upon their own Axes, and in some of them also, it's
probable, about other Points, if we admit the Hypothesis of every fix'd Star's being a Sun or
Sun-like Body, and having a Choire of Planets, in like manner moving about him. These
Revolutions, we have Reason to believe, are as exactly equal and uniform as the Earth's are;
which could not be, were there any Place for chance, and did not a Providence continually
over-see and secure them from all Alteration or Immunion, which either internal Changes
in their own Parts, or external Accidents and Occurrence, would at one time or other
necessarily

*63
induce. Without this circular motion of the Earth, here could be no living: One Hemisphere
would be condemn'd to perpetual Cold and Darkness, the other continually roasted and
parch'd by the Sun-beams. And it is reasonable to think, that this circular Motion is as
necessary to most other Planetary Bodies, as it is to the Earth. As for the fix'd Stars, if they
be Sun-like Bodies, it is is probable also each of them moves circularly upon its own Axis as
the Sun doth: But what Necessity there is of such a Motion, for Want of understanding the
Nature of those Bodies, I must confess myself not yet to comprehend; tho' that it is very
great I doubt not, both for themselves, and for Bodies about them.

First, for the Celestial or Heavenly Bodies, the Equability and Constancy of their Motions,
the Certainty of their Periods and Revolutions, the Conveniency of their Order and
Situations, argue then to be ordain'd and govern'd by Wisdom and Understanding; yea, so
much Wisdom as Man cannot easily fathom or comprehend: For we see, by how much the
hypotheses of Astronomers are more simple and conformable to reason, by so much do they
give a better Account of the Heavenly Motions. It is reported of Alphonsus King of Aragon,
(I know not whether truly) that when he saw and consider'd the many Eccentricks,
Epicycles, Epicycles upon Epicycles, Librations, and Contrariety of Motions, which were
requisite in th old Hypothesis to give an Account of the Celestial

*64
Phaenomena, he should prefume blasphemously to say, that the Universe was a bungling
Piece; and that if he had been of God’s Counsel, he could have directed him to have made it
better. A Speech as rash and ignorant, as daring and prophane.

For it was nothing but Ignorance of the true Process of Nature that induced the Contrivers of
that Hypothesis to invent such absurd Suppositions, and him to accept them for true, and
attribute them to the great Author of the Heavenly Motions: For in the New Hypothesis of
the modern Astronomers, we see most of those Absurdities and Irregularities rectified and
remov'd, and I doubt not but they would all vanish, could we certainly discover the true
Method and Process of Nature in those Revolutions: for Seeing in those Works of Nature
which we converse with, we constantly find those Axioms true, <>Natura non facit
circuitus,
Nature doth not fetch a Compass when it may proceed in a streight Line; and <>Natura nec
abundat in superfluis, nec deficit in necessariis, Nature abounds not in what is superfluous,
neither is deficient in what is necessary. We may also rationally conclude concerning the
Heavenly Bodies, seeing there is so much Exactness observ'd in the Time of their Motions,
that they punctually come about in the same Periods to the Hundredth Part of a Minute, as
may beyond Exception be demonstrated by comparing their Revolutions, surely there is also
used the most simple, facile, and convenient Way for
the Performance of them.

Among these Heavenly Bodies;

First, the Sun, a vast Globe of Fire, esteemed by the ancients and most modest Computation above 160 times bigger than the Earth, the very Life of this inferior World, without whose salutary and vivifying Beams all Motion both Animal, Vital and Natural would speedily cease, and nothing be left here below but Darkness and Death. All Plants and Animals must needs in a very short Time be not only mortified, but, together with the Surface of Land and Water, frozen as hard as a Flint or Adamant: So that of all the Creatures of the World the ancient Heathen had most Reason to worship him as a God, tho' no true Reason; because he was but a Creature, and not God: And we Christians do think that the Service of the Animals that live upon the Earth, and principally Man, was one End of his Creation; seeing without him there could no such Things have been. This Sun, I say, according to the old Hypothesis, whirl'd round about the Earth daily with incredible Celerity, making Night and Day by his rising and setting; Winter and Summer by his Access to the Several Tropicks, creating such a grateful variety of Seasons, enlightening all Parts of the Earth by his Beams, and cherishing them by his Heat, situate and mov'd so in Respect of this sublunary World (and it's likely also in Respect of all the Planets about him) that Art and Counsel could not have Design'd either to have placed him better,

or mov'd him more conveniently for the Service thereof, as I could easily make appear by the Inconveniences that would follow upon the Supposition of any other Situation and Motion, shews forth the great Wisdom of him who so dispos'd and mov'd him.

Secondly, The Moon, a Body in all Probability somewhat like the Earth we live upon, by its constant and regular Motion, helps us to divide our Time, reflects the Sun-beams to us, and so by illuminating the Air, takes away in some Measure the disconsolate darkness of our winter Nights; procures or at least regulates the Fluxes and Refluxes of the Sea, whereby the Water is kept in constant Motion, and preserv'd from Putrefaction, and so render'd more salutary for the Maintenance of its Breed, and useful and serviceable for Man's Convenience of Fishing and Navigation; not to mention the great Influence it is suppos'd to have upon all moist Bodies, and the Growth and Increase of Vegetables and Animals: Men generally observing the Age of the Moon in the planting of all Kinds of Trees, sowing of Grain, grafting and inoculating, and pruning of Fruit-Trees, gathering of Fruit, cutting of Corn or Grass; and thence also making Prognosticks of Weather, Because such Observations seems to me uncertain. Did this Luminary serve to no other Ends and Uses, as I am Persuaded it doth many, especially to maintain the Creatures which in all likelyhood breed and inhabit there, for which I refer you to the ingenious Treatises written by Bishop Wilkins and

Monsieur Fontenelle on that Subject, yet these were enough to evince it to be the Effect and Product of Divine Wisdom and Power.

Thirdly, As for the rest of the Planets besides their particular Uses, which are to Us unknown, or meerly conjectural, their Courses and Revolutions, their Stations and Retrogradations, observ'd constantly so many Ages together in most certain and determinate Periods of Time, do sufficiently demonstrate that their Motions are instituted and govern'd by Counsel, Wisdom and Understanding.
Fourthly, The like may be said of the fix'd Stars, whose Motions are regular, equal and constant: So that we see nothing in the Heavens which argues Chance, Vanity of Error; but, on the contrary, Rule, Order, and Constancy; the Effects and Arguments of Wisdom: Wherefore, as Cicero excellently concludes, <>Coelestem ergo admirabilem ordinem incredibilemque constantium, ex qua conservatio et salus omnium omnis oritur, qui vacare mente putat, noe ipse mentis expers habendus est. : Wherfore whoever thinketh that the admirable Order and incredible Constancy of the Heavenly Bodies and their Motions, whereupon the Preservation and Welfare of all Things doth depend, is not governed by Mind and Understanding, he himself is to be accounted void thereof.

And again, "shall we (saith he) when we see an Artificial Engine, as a Sphere or Dyal, or the like, at first Sight acknowledge, that it is a Work of Reason and Art? <>Cum autem impetum

*68 coeli, admirabili cum celeritate moveri vertique videamus, constantissime conscientem vicissitudines anniversarias, cum summa Salute et conservatione rerum omnium, dubitare quin ea non solum ratione fiant, sed excellenti quadam Divinaque ratione: " And can we, when we see the Force of the Heavens mov'd and whirl'd about with admirable Celerity, most constantly finishing its anniversary Vicissitudes, to the eminent Welfare and Preservation of all Things, doubt at all that these Things are perform'd not only by Reason, but by a certain excellent and divine Reason?

To these Things I shall add an Observation which I must confess myself to have borrowed of the honourable Person more than once mention'd already, that even the Eclipses of the Sun and Moon, though they be frightful Things to the superstitious Vulgar, and of ill Influence on Mankind, if we may believe the no less superstitious astrologers, yet to knowing Men, that can skilfully apply them, they are of great Use, and such as common Heads could never have imagin'd: Since not only they may on divers Occasions help to settle Chronology, and rectifie the Mistakes of Historians that writ many Ages ago; but which is, though a less Wonder, yet of greater Utility, they are (as Things yet Stand) necessary to define with competent certainty, the Longitude of Places or Points on the Terraqueous Globe, which is a Thing of very great Moment not only to Geography, but to the most useful and important

*69 Art of Navigation. To which may be added, which I shall hereafter mention, that they serve to demonstrate the spherical Roundness of the Earth: So that I may well conclude with the Psalmist, Psalm 19.1. The Heavens declare the Glory of God, and the Firmament sheweth his handy Work.

Of Terrestrial and Inanimate Simple Bodies

I come now to consider the Terrestrial Bodies; I shall say nothing of the whole Body of the Earth in general, Because I reserve that as one of the Particulars I shall more carefully and curiously examine.

Terrestrial Bodies, according to our Method before propounded, are either inanimate or animate, and the inanimate either simple or mixt. Simple, as the four Elements, leire, Waters EartaJ and Sir: I call these Eleznents in Compliance (as I said before) with the vulgarly-receiv'd Opinion; not that I think them to be: the Principles or component
Ingredients of all other sublunary Bodies: I might call them the four great Aggregates of Bodies of the same Species, or four Sorts of Bodies, of which there are great Aggregates. These, notwithstanding that they are endued with contrary Qualities, and are continually encroaching one upon another, yet they are so balanc'd, and kept in such an Equilibrium, that neither prevaleth over other, but what one gets in one Place it loseth in another.

First, Fire cherisheth and reviveth by its Heat, without which all Things would be torpid

and without Motion, nay, without Fire no Life, it being the vital Flame residing in the Blood that keeps the bodily Machine in Motion, and renders it a fit Organ for the Soul to work by. The Uses of Fire (I do not here speak of the Peripateticks’ Elementary Fire in the Concave of the Moon, which is but a meer figment, but our ordinary Culinary) are in a manner infinite for dressing and preparing of Victuals, bak'd, boil'd and rost; for melting and refining of Metals and Minerals; for the fusion of Glass, [a Material whose Uses are so many, that it is not easie to enumerate them, it serving us to make Windows for our Houses, Drinking-Vessels, Vessels to contain and preserve all Sorts of fermented Liquors, distill'd Waters, Spirits, Oils, Extracts, and other Chymical Preparations, as also Vessels to distil and prepare them in; for Looking-Glasses, Spectacles, Microscopes and Telescopes, whereby our Sight is not only reliev'd, but wonderfully assisted to make rare Discoveries] for making all Sorts of Instruments for Husbandry, mechanick Arts and Trade, all Sorts of Arms or Weapons of War defensive and offensive; for fulminating Engines; for burning of Lime, baking of Bricks, Tiles, and all Sorts of Potters Vessels or Earthen Ware, for casting and forging Metaline Vessels and Utensils; for Distillations, and all Chymical Operations hinted before in the Use of Glass; for affording us Lights for any Work or Exercise in Winter Nights; for digging in Mines and dark Caverns; and, finally, by its comfortable Warmth

securing us from the Injuries of Cold, or relieving us when we have been bitten and benum'd with it. A Subject or Utensil of so various and inexplicable Use, who could have invented and formed, but an infinitely wise and powerful Efficient?

Secondly, The Air serves us and all Animals to breath in, containing the Fewel of the vital Flame we speak of, without which it would speedily languish and go out; so necessary it is for us and other Land-Animals that without the Use of it we could live but very few Minutes: Nay, Fishes and other Water-Animals cannot abide without the Use of it; for if you put Fish into a Vessel of a narrow Mouth full of Water, they will live and swim there, not only Days and Months, but even Years; but if with your Hand or any other Cover you stop the Vessel so as wholly to exclude the Air, or interrupt its Communication with the Water, they will suddenly be suffocated; as Rondeletius affirms he often experimented.

If you fill not the Vessel up to the Top, but leave some Space empty for the Air to take up, and then clap your Hand upon the Mouth of the Vessel, the Fishes will presently contend which shall get uppermost in the Water, that so they may enjoy the open Air; which I have also observ’d them to do in a Pool of Water that hath been almost dry in the Summer-Time, because the Air that insinuated itself into the Water did not suffice them for Respiration. Neither is it less

necessary for Insects than it is for other Animals, but rather more, these having more Air-Vessels for their Bulk by far than they, there being many Orifices on each Side their Bodies for the Admission of Air, which if you stop with Oil or Honey, the Insect presently dies, and
revives no more. This was an Observation of the Ancients, though the Reason of it they did not understand; (<>Oleo illito Insecta omnia ex animantur.<> Pliny.) which was nothing but the intercluding of the Air; for tho' you put Oil upon them, if you put it not upon or obstruct those Orifices therewith, whereby they draw the Air, they suffer nothing: If you obstruct only some, and not others, the Parts which are near and supplied with Air, from thence are by and by convulsed and shortly relaxed and deprived of Motion, the rest that were untouched still retaining it. Nay, more than all this, Plants themselves have a Kind of Respiration, being furnish'd with plenty of Vessels for the Derivation of Air to all their Parts; as hath been observ'd, nay, first discover'd, by that great and curious Naturalist <>Malpighius<>.

Another Use of the Air is to sustain the Flight of Birds and Insects. Moreover, by its gravity it raises the Water in Pumps, Siphons and other Engines, and performs all those Feats which former Philosophers through Ignorance of the Efficient Cause attributed to a Final, namely, Nature's abhorrence of a Vacuity or empty space. The elastic or expansive Faculty of the Air, whereby it dilates itself, when compressed,

*73

(indeed this lower Region of it, by Reason of the Weight of the Superincumbent, is always in a compressed State) hath been made Use in the common Weather-glasses, in Wind-guns, and in several ingenious Water-Works, and doubtless hath a great Interest in many natural Effects and Operations.

Against what we have said of the Necessity of the Air for the Maintenance of the Vital Flame it may be objected, That the Foetus in the Womb lives, its Heart pulses, and its Blood circulates; and yet it draws in no Air, neither hath the Air any Access to it. To which I answer; That it doth receive Air, so much as sufficient for it in its present State, from the maternal Blood by the <>Placenta uterina<> or the Cotyledons. This Opinion generally propounded, viz. That the Respiration of the Dam dl serve the Foetus also, or supply sufficient Air to it, I have met with in Books; but the explicit Notion of it I owe to my Learned and Worthy Friend Dr. <name>Edward Hulse<>., which, comparing with mine own Anatomical Observations, I found so consonant to Reason, and highly probable, that I could not but yield a firm Assent to it. I say then, That the chief Use of the Circulation of the Blood through the Cotyledons of a Calf in the Womb (which I have often dissected) and by Analogy thro' the Placenta uterina in an Humane Foetus, seems to be the Impregnation of the Blood with Air, for the feeding of the vital Flame: For if it were only for Nutrition, what Need of two such great Arteries to convey the Blood thither? It would (one might rationally think) be more likely, that as in the Abdomen of every Animal, so here, there should have been some lacteal Veins form'd, beginning from the Placenta or Cotyledons, which concurring in one common Ductus, should at last empty themselves into the <>Vena cava.

Secondly, I have observed in a Calf, the Umbilical Vessels to terminate in certain Bodies divided into a Multitude of carneous Papillae, (as I may so call them) which are receiv'd into so many Sockets of the Cotyledons growing on the Womb; which carneous Papillae may without Force or Laceration be drawn out of those Sockets. Now these Papillae do well resemble the Aristoe or Radii of a Fish’s Gills, and very probably have the same Use to take in the Air; so that the maternal Blood which flows to the Cotyledons, and encircles these Papillae, communicates by them to the Blood of the Foetus, the Air wherewith itself is
impregnate; as the Water flowing about the carneous Radii of the Fish's Gills doth the Air that is lodg'd therein to them.

Thirdly, That the maternal Blood flows most copiously to the Placenta uterina in Women, is manifest from the great Hemorrhagy that succeeds the Separation thereof at the Birth.

Fourthly, After the Stomach and Intestines are form'd, the Foetus seems to take in its whole Nourishment by the Mouth; there being always found in the Stomach of a Calf plenty of the Liquor contain'd in the Amnios wherein he swims, and Faeces in his Intestines) and

*75
Abundance of Urine in the <>Allantoides; so that the Foetus in the Womb doth live as it were the Life of a Fish.

Lastly, Why else should there be such an instant Necesity of Respiration so soon as ever the Foetus is fallen off from the Womb.

I know that if the Foetus be taken out of the Womb inclos'd in the Secundines, it will continue to live, and the Blood to circulate for a considerable Time, as Dr. Harvey observes. The reason whereof I conceive to be, because the Blood still circulates through the Cotyledons or Placenta, which are now expos'd to the open Air, and so from thence receives sufficient Supplies thereof, to continue its gentle Motion and feed the vital Flame. But when, upon exclusion of the Young, the Umbilical Vessels are broken, and no more Air is receiv'd that Way, the Plastick Nature, to preserve the Life of the Animal, speedily raises the Lungs, and draws into them Air in great Abundance, which causes a sudden and mighty Accension in the Blood; to the Maintenance whereof a far greater Quantity of Air is requisite, than would serve to feed the mild and languid Flame before.

This Way we may give a facile and very probable Account of it, to wit, because receiving no more Communications of Air from its Dam or Mother, it must needs have a speedy Supply from without, or else extinguish and die for Want of it; being not able to live longer

*76
without Air at its first Birth, than it can do afterward.

Upon this Occasion, give me leave to discourse a little concerning the Air's insinuating itself into the Water. I say therefore, That the Air, at least that Part of it which is the Aliment of Fire, and Fewel of the vital Flame in Animals, easily penetrates the Body of Water expos'd to it, and diffuseth itself through every Part of it. Hence it is that we' find Fish in subterraneous Rivers, and some Fish in the Earth itself; which can no more live without Air there than in the open Waters: Hence the Miners, when they come once at water, are out of all Danger of Damps. You'll say, How gets the Air into the Water in Subterraneous Rivers, and into the Earth to the fossil Fishes; I Answer, The same Way that the Water doth: Which I suppose to be by its upper Superficies; the Water descending by Pores and Passages that there it finds into Chinks and Veins, and by Confluence of many of them by Degrees swelling into a Stream, the Air accompanies and follows it by a conltant Succession.

As for fossil Fishes, some make their Way into the Earth up the Veins of Water opening into the Banks of Rivers, where they lie till they grow so great that they cannot return: In which Veins they find Air enough to serve their Turn, needing not much by Reason that they lie still, and move but little. Others in Times of Floods are left in the Meadows and with the Water sink into the Earth.
at some Holes and Pores that the Water finds or makes, by which also they are supplied with Air. The Reason why the Miners are out of Danger of Damps when they come to Water, I conceive is, because then presently the Air that stagnated in the Shaft sinks into the Water, and fresh Air descends and succeeds, and so there is a Circulation; in the same Manner as by the sinking of an Air-Shaft the Air hath Liberty to circulate, and carry out the Steams both of the Miners Breath and the Damps, which would otherwise stagnate there. Indeed, though there were no Damps, yet the nitrous Part of the Air being spent and consum'd by the breathing of the Miners, the remaining Part would be render'd altogether unfit for Respiration, unless new and fresh Air could succeed.

And here methinks appears a Necessity of bringing in the Agency of some Super-intendent intelligent Being, be it a Plastick Nature, or what you will: For what else should put the Diaphragm, and all the Muscles Serving to Respiration, in Motion all of a sudden so soon as ever the Foetus is brought forth? Why could they not have rested as well as they did in the Womb? What aileth them that they must needs bestir themselves to get in Air to maintain the Creature's Life? Why could they not patiently suffer it to die? That the Air of itself could not rush in, is clear; for that, on the contrary there is requir'd some Force to remove the incumbent Air, and make Room for the External to enter. You will say, the Spirits do at this

Time flow to the Organs of Respiration, the Diaphragm and other Muscles which concur to that Action, and move them. But what rouses the Spirits, which were quiescent during the Continuance of the Foetus in the Womb? Here is no appearing Impellent but the external Air, the Body suffering no Change but of Place, out of its close and warm Prison into the open and cool Air: But how or why that Should have such an Influence upon the Spirits, as to drive them into those Muscles electively, I am not subtil enough to discern. As for the Respiration of the Chick in the Egg, I suppose the Air not only to be included in the White, but also to be supply'd through the Shell and Membranes.

Thirdly, Water is one Part, and that not the least of our Sustenance, and that affords the greatest Share of Matter in all Productions, being not (as it exists in the World) a simple and unmix'd Body, but containing in it the Principles or minute component Particles of all Bodies: To speak nothing of those inferior Uses of Washing and Bathing, dressing and preparing victuals. But if we shall consider the great Concepts and Congregations of Water, and the Distribution of it all over the dry Land in Springs and Rivers, there will occur abundant Arguments of Wisdom and Understanding. The Sea, what infinite Variety of Fishes doth it nourish! Psalm 104. 25. In the Verse next to my Text; The Earth is full of thy Riches: So is this great and wide Sea, wherein are Things

creeping innumerable, both small and great Beasts, &c. How doth it exactly compose itself to Level or equal Superficies, and with the Earth make up one Spherical Roundness? How doth it constantly observe its Ebb's and Flows, its Spring and Nepe-tides, and still retain its Saltness, so convenient for the Maintenance of its Inhabitants, serving also the Uses of Man for Navigation, and the Convenience of Carriage? That it should be defined by Shores and Strands and Limits, I mean at first, when it was natural to it to overflow and stand above the Earth. All these Particulars declare Abundance of Wisdom in their primitive Constitution. This last the Psalmist takes Notice of in the 6th, 7th, 8th, and 9th Verses of this Psalm: Speaking of the Earth at the first Creation, he saith, Thou coveredst it with the Deep as with
a Garment, the waters stood above the Mountains: At thy rebuke they fled, at the Voice of thy Thunder they hasted away (the Mountains ascend, the Valleys descend) unto the Place thou hast prepared for them. Thou hast set a Bound that they may not pass over: That they turn not again to cover the Earth. But what Need was there (may some say) that the Sea should be made so large, the its Superficies should equal if not exceed that of the dry Land? Where is the Wisdom of the Creator in making so much useless Sea, and so little dry Land, which would have been far more beneficial and serviceable to Mankind? Might not at least half the Sea have been spar'd and added to the Land, for the Entertainment

*80

and Maintenance of Men, who by their continual Striving and Fighting to enlarge their Bounds, and encroaching upon one another, seems to be straitened for Want of Room.

To this Objection against the Wisdom of God in thus dividing Sea and Land, Mr. Keil, in his Examination of Dr. Burnet's Theory of the Earth, p.92, 93. thus answers: This, as most other of the Atheists’ Arguments, proceeds from a deep ignorance of Natural Philosophy; for if there were but half the Sea that now is, there would be also but half the Quantity of Vapours, and consequently we could have but half so many Rivers as now there are to supply all the dry Land we have at present, and half as much more; for the Quantity of Vapours which are rais'd, bears a Proportion to the Surface whence they are rais'd, as well as to the Heat which rais'd them. The wise Creator therefore did so prudently order it that the Sea should be large enough to supply Vapours sufficient for all the Land, which it would not do if it were less than now it is.

But against this it may be objected, Why should not all the Vapours which are rais'd out of the Sea fall down again into it by Rain? Is there not as much Reason that the Vapours which are exhaled out of the Earth should be carried down to the Sea, as that those raised out of the Sea be brought up upon the dry Land? If some by Winds be driven from the Sea up Land, others by the same Cause will be blown down from Land to Sea, and so balancing one another, they will in Sum fall

*81
equally upon Sea and Land; and consequently the Sea contribute nothing to the Watering the Earth, or the Maintenance of Rivers.

To which I answer, That as to the Watering of the Earth these needs no Supply from the Sea, there being sufficient Water exhaled out of itself to do that; there is no more return’d upon it by Rain so as to Rest upon it, than an equivalent quantity to what was rais’d of of it.

But the Rivers must be supplied otherways. Our Opinion is, That they have their Supply from Rain and Vapours. The Qeuestion is, Whence these Vapours are brought? We answer, From the Sea. But what brings them up from the Sea? I answer, The Winds: And so I am arriv'd at the main Difficulty. Why should not the Winds carry them that are exhaled out of the Earth down to the Sea, as well as bring them up upon the Earth, which are rais'd from the Sea. Or which is all one, why should not the Winds blow indifferently from Sea and Land? To which I answer, That I must needs acknowledge myself not to comprehend the Reason hereof. God is truly said, Psalm 135.7. To bring the Wind out of his Treasures. But the Matter of Fact is most certain, viz. That the Winds do bring abundantly more Vapour up from the Sea than they carry down thither.

First, because otherwise there can no Account be given of Floods. It is clear, That Floods with us proceed from Rain; and it is often a vast Quantity of Water they carry down
to the Sea. Whence come those Vapours which supply all this Water? I hope those who bring up Springs and Rivers from the great Abyss, will not bring those Vapours, which unite into Drops, and descend in Rain from thence too. Should they rise from the dry Land only, they would soon render it dry indeed; more parch'd than the Desarts of Libya. We should quickly come to an End of Floods, and of Rain too, if nothing were return'd from the Sea again, not to mention, that the Sea must needs in such a Case overflow its Shores, and enlarge its bounds.

But this Way there is an easy Account to be given. It is clear, that the Sun doth exhale Vapours both from Sea and Land; and that the Superficies of Sea and Land is sufficient to yield Vapours for Rain, Rivers and Floods, when heated to such a Degree as the Sun heats it: So that there wants only Wind to bring up so great a Proportion of Vapours from the Sea as may afford Water for the Floods; that is, so much as is return'd back again to the Sea.

Some may perchance demand, To what Purpose serve the Floods? What use is there of them? I answer, To return back to the Sea the Surplusage of Water after the Earth is sated with Rain. It may be further ask'd, What need more Rain be pour'd upon the Earth than is sufficient to water it? I reply, That the Rain brings down from the Mountains and higher grounds a great Quantity of Earth, and in Times of Floods spreads it upon the Meadows and Levels, rendering them thereby so fruitful as to

stand in Need of no Culture or Manuring. So we see the Land of Egypt owes its great Fertility to the Annual Overflowing of the River Nilus: And it's likely the Countries bordering upon the River of Ganges may receive the like benefit by the Overflowing thereof. Moreover, all Rain-water contains in it a copious Sediment of Terrestrial Matter, which by standing it precipitates, and is not a simple Elementary Water. This Terrestrial Matter serves for the Nourishment of Plants, and not the Water itself, which is but a Vehicle to derive this Nutriment to all the Parts of the Plants: And therefore the more Rain, the more of this Nutricious Matter may be precipitated upon the Earth, and so the Earth render'd more fruitful. Besides all this, it's not unlikely, that the Rain-water may be endu'd with some vegetating or prolifick Virtue, deriv'd from some Saline or Oleose Particles it contains: For we see, that Aquatick Plants, which grow in the very Water, do not thrive and flourish in dry Summers, when they are not also water'd with the Dew of Heaven.

Secondly, Another Argument to prove, That the Winds bring up more Vapours from the Sea than they carry down thither, is, Because the Winds do more frequently blow from the Sea than to the Sea. This appears from the Trees which grow on and near the Sea-shores all along the Western Coast of England, whose Heads and Boughs I have observ'd to run out far to Landward, but toward the Sea to be so snub'd by the

Winds, as if their Boughs and Leaves had been par'd or shaven off on that Side.

It is also observ'd, that the Western Wind, which is the most violent and boisterous of all with us in England, which comes from off the great Atlantick Ocean, is of longest Continuance. Julius Caesar, in his 5th Book of Commentaries de Bello Gallico, saith of it, Magnam partem omnis temporis in his locis fluere consuevit; it is wont to blow in these Quarters a great Part of the whole Year: Which Observation holds true at this Day, the Wind lying in that Corner at least three Quarters of the Year.
Since this Motion of the Winds is constant, there is doubtless a constant and settled Cause of it, which deserves to be enquir'd into, and search'd out by the Study and Endeavours of the most sagacious Naturalists. But however the Wind be rais'd, it may more easily blow from Sea to Land, than from Land to Sea, because the Superficies of the Sea being even or level, there is nothing to stop its Course; but on the Land there are not only Woods, but Mountains to hinder and divert it.

Having myself seen so much of the Bottom of the Sea round about the Coasts of England and a great Part of the Low Countries, of Italy and Sicily, I must needs adhere to what I deliver'd, That where the Bottom of the Sea is not Rocky, but Earth, Owze or Sand, and that is incomparably the greatest Part of it, it is by the Motion of the Waters, so far as the Reciprocation of the Sea extends to the Bottom, brought

*85* to a Level; and if it should be now unequal, would in Time be level'd again. By Level I do not mean so as to have no Declivity (for the Reciprocation preserves that, the Flood hindering the constant carrying down of the Bottom) but only to have an equal and uniform Descent from the Shores to the Deeps. Now all those Relations of Urinators belong only to those Places where they have dived, which are always Rocky for there is no Reason why they should dive whebre the Bottom is level and sandy. That the Motion of the Water descends to a good Depth, I prove from those Plants that grow deepest in the Sea, because they all generally grow flat, in Manner of a Fan, and not with Branches on all Sides like Trees; which is so contriv'd by the Providence of Nature, for that the Edges of them do in that Posture with most ease cut the Water flowing to and fro; and should the flat Side be objected to the Stream, it would soon be turn'd Edge-Wise by the Force of it, because in that Site it doth least resist the Motion of the Water: Whereas did the Branches of these Plants grow round, they would be thrown backward and forward every Tide. Nay, not only the Herbaceous and Woody Submarine Plants, but also the *<bot>Lithophyta</bot>*<margin>Stone-Plants</margin> themselves affect this Manner of growing, as I have observ'd in various Kinds of Corals and Pori. Hence I suspect all those Relations concerning Trees growing at the Bottom of the Sea and bringing forth Fruit there: And as for the *<bot>Maldiva Nut</bot>*, till better Information, I adhere

*86* to *<name>Garcia</name>*’s Opinion, which may be seen in *<name>Clusius</name>*. Further I do believe, that in the great Depths of the Sea there grow no Plants at all, the bottom being too remote from the external Air, which though it may pierce the Water so low, yet I doubt whether in quantity sufficient for the Vegetation of Plants: Nay, we are told, That in those deep and bottomless Seas there are no Fish at all; yet not Because there are no Plants or Insects to feed them, for that they can live upon Water alone, *<name>Rondeletius</name>*’s Experiment about keeping them in a Glass doth undeniably prove, but because their Spawn would be lost in those Seas, the Bottom being too cold for it to quicken there; or rather because being lighter than the Water there, it would not sink to the Bottom, but be buoy'd up by it, and carried away to the Shallows.

Again, The great Use and Convenience, the Beauty and Variety of so many Springs and Fountains, so many Brooks and Rivers, so many Lakes and Standing Pools of Water, and these so scatter'd and diepers'd all the Earth over; that no great Part of it is destitute of them, without which it must, without a Supply otherways, be desolate and void of Inhabitants; afford abundant Arguments of Wisdom and Counsel: That Springs should break forth on the sides of Mountains most remote from the Sea: That there should Way be made for
Rivers thro' Straits and Rocks, and subterraneous Vaults, so that one would think that Nature had cut a Way on Purpose to derive the Water, which else

*87
would overflow and drown whole Countries: That the Water passing thro' the Veins of Earth, should be rendred fresh and potable, which it cannot be by any Percolations we can make, but the saline Particles will pass thro' a tenfold Filtre: That in some Places there should spring forth Metalick and Mineral Waters, and hot Baths, and these so constant and permanent for many Ages; so convenient for divers Medicinal Intentions and Uses, the Causes of which Things, or the Means and Methods which they are perform'd, have not been as certainly discover'd; only in general, Pliny’s Remark may be true, <latin>Tales sunt aquae, qualais terra per quam fluunt</latin>. Hence they are Cold, Hot, Sweet, Stinking, Purgative, Diuretick or Ferrugeinous, Saline, Petrefying, Bituminose, Venenose, and of other Qualities.

Lastly, The Earth, which is the Basis and Support of all Animals and Plants, and affords them the hard and solid Part of their Bodies, yielding us Food and Sustenance, and partly also Cloathing; for I do not think that Water supplies Man and other Animals, or even Plants themselves, with their Nourishment, but serves chiefly for a Vehicle to the alimentary Particles, to convey and distribute them to the severl Parts of the Body. Water, as it exists in the World, is not a simple unmix'd Body, but contains the Terrestrial component Parts of the Bodies of Animals and Plants: Simple Elementary Water nourishes not at all. How variously is the Surface of this Earth distinguish'd into

*88
Hills, and Valleys, and Plains, and high Mountains, affording pleasant Prospects? How Curiously cloath'd and adorn'd with the grateful verdure of Herbs and stately Trees, either dispers'd and scatter'd singly, or as it were assembled in Woods and Groves, and all these beautified and illustrated with Elegant Flowers and Fruits, <latin>quorum omnium incredibilis multitudo, insatiabili varietate distinguitur</latin>, as Tully saith. This also shews forth to them that consider it, both the Power and Wisdom of God: So that we may conclude with Solomon, Prov. 3. 19. <bib>The Lord by Wisdom hath founded the Earth, by Understanding hath he establish'd the Heavens.</bib>

But now, if we pass from Simple to Mix'd Bodies, we shall still find more Matter of Admiration, and argument of Wisdom. Of these we shall first consider those they call imperfectly Mix'd, or Meteors.

Of Meteors.

As first of all, Rain, which is nothing else but Water, by the Heat of the Sun divided into very small invisible Parts, ascending in the Air, till encountering the Cold, it be by Degrees condens'd into Clouds, and descends in Drops; this, though it be exhaled from the Salt Sea, yet by this Natural Distillation is render'd fresh and potable, which our Artificial Distillations have hitherto been hardly able to effect; notwithstanding the Errninent Use it would be of to Navigators, and the Rewards promis'd to those that

*89
should resolve that Problem of distilling fresh Water out of Salt. That the Clouds should be so carried about by the Winds, as to be almost equally diepers'd and distributed, no Part of the Earth wanting convenient Showers, unless when it Pleaseth God, for the Punishment of a Nation, to with-hold Rain by a special Interposition of his Providence, or, if any Land wants
Rain, they have a Supply some other Way; as the Land of Egypt, though there seldom falls any Rain there, yet hath abundant recompence made it by the annual Overflowing of the River. This Distribution of the Clouds and Rain is to me (I say) a great Argument of Providence and Divine Disposition; for else I do not see but why there might be in some Lands continual successive Droughts for many Years, till they were quite depopulated; in others as lasting Rains till they were overflowed and drown'd; and these, if the Clouds mov'd casually, often happening; whereas since the ancientest Records of History we do not read or hear of any such Droughts or Inundations, unless perhaps that of <place>Cyprus</place>, wherein there fell no Rain there for Thirty six Years, till the Island was almost quite deserted, in the Reign of Constantine; which doubtless fell not out without the Wise Disposition of Providence, for great and weighty Reasons.

Again, If we consider the Manner of the Rain's Descent, distilling down gradually, and by Drops, which is most convenient for the watering of the Earth; whereas, if it should fall down

*90*

in a continual Stream like a River, it would gall the Ground, wash away Plants by the Roots, overthrow Houses, and greatly incommodate, if not suffocate Animals: If, I say, we consider these Things, and many more that might be added, we might in this respect also cry out with the Apostle, <bib>O the Depth of the Riches both of the Wisdom and Knowledge of God !</bib>

Secondly, Another Meteor is the Wind; Which how many Uses it doth serve to, is not easie to enumerate, but many it doth, qviz. to ventilate and break the Air, and dissipate noisom and contagious Vapours, which otherwise stagnating, might occasion many Diseases in Animals; and therefore it is an Observation concerning our Native Country, <latin>Anglia ventosa, si non ventosa, venenosa</latin>: To transfer the Clouds from Place to Place, for the more commodious watering of the Earth: To temper the Excesses of the Heat, as they find, who in Brazil, New Spain, the Neighbouring Islands, and other the like Countries near the Equator, reap the Benefit of the Breezes: To fill the Sails of Ships, and carry them on their Voyages to remote Countries, which, of what eminent Advantage it is to Mankind, for the procuring and continuing of Trade and mutual Commerce betv cen the most distant Nations, the illustrating every Corner of the Earth, and the perfecting Geography and Natural History, is apparent to every Man. That the Monsoons and Trade-winds should be so constant and periodical even to the 30th Degree of Latitude all round the Globe,

*91*

and that they should so seldom transgress or fall short of those Bounds, is a Subject worthy of the Thoughts of the greatest Philosophers. To this may be added the driving about of Windmills for grinding of Corn, making of Oil, draining of Pools, raising of Water, sawing of Wood, fulling of Cloth, &c. That it should seldom or never be so violent and boisterous, as to overturn Houses; yea, whole Cities; to tear up Trees by the Roots, and prostrate Woods; to drive the Sea over the lower Countries; as were it the Effect of Chance, or mere natural Causes not moderated by a superiour Power, it would in all likelihood often do. Hurricanes, Spouts, and Inundations would be more frequent than they are. All these Things declare the wisdom and Goodness of Him <bib>who bringeth the Wind out of his Treasures</bib>.

Of Inanimate Mix'd Bodies.
I proceed now to such inanimate Bodies are called Perfecte Mixta, perfectly mixt, improperly enough, they being many of them (for ought I know) as simple as those they call Elements. These are Stones, Metals, Minerals and Salts.

In Stones, which one would think were a neglected Genus, what Variety? What Beauty and Elegancy? What Constancy in their Temper and Consistency in their Figures and Colours? I shall speak of first some notable Qualities wherewith some of them are endued. Secondly, the

*92 remarkable Uses they are of to us. The Qualities I shall instance in are, First, Colour, which in some of them is most lively, sparkling, and beautiful; the Carbuncle or Rubine shining with red, the Sapphire with blue, the Emerald with green, the Topaz, or Chrysolyte of the Ancients, with a yellow or Gold-colour, the Amethyst as it were tinctured with Wine, the Opal varying its Colours like changeable Taffata, as it is diversly expos'd to the Light. Secondly, Hardness, wherein some Stones exceed all other Bodies, and among them the Adamant all other Stones, being exalted to that Degree thereof, that Art in vain endeavours to counterfeit it, the factitious Stones of Chymists in Imitation being easily detected by an ordinary Lapidist. Thirdly, Figure, Many of them shoot into regular Figures, as Crystal and bastard Diamonds into hexagonal; others into those that are more elegant and compounded, as those form’d in Imitation of the Shells of Testaceous Fishes of all Sorts, Sharks Teeth and Vertebres, &c. If these be originally Stones, or primary Productions of Nature in Imitation of Shells and Fishes Bones, and not the Shells and Bones themselves petrified, as we have sometimes thought. Some have a Kind of Vegetation and Resemblance of Plants, as Corals, Pori, and Fungites, which grow upon the Rocks like Shrubs: To which I might add our ordinary Star-stones and Trochites, which I look upon as a Sort of Rock-Plants.

*93 Secondly, For the Uses; some serve for Building and many sorts of Vessels and Utensils; for Pillars and Statues and other carved works in <I>relieve</I>, for the Temples, Ornaments of Palaces, Portico's, Piazza's, Conduits, &c. as Freestone and Marble; some to burn into Lime, as Chalk and Limestone; some, with the Mixture of Beriglia or Kelp, to make Glass, as that the Venetians call Cuogolo, and common Flints, which serve also to strike Fire; some to cover Houses, as Slates, some for marking, as Morochthus, and the fore-mentioned Chalk, which is a <gk>poluKrEson</gk>, serving moreover for manuring Land, and some Medicinal Uses; some to make Vessels of which will endure the Fire, as that found in the Country of <place>Chiavenna</place> near Plurs. To these useful Stones I might add the Warming-Stone, digg’d in Cornwall, which being once well heated at the Fire, retains its Warmth a great while, and hath been found to give Ease and Relief in several Pains and Diseases, particularly in that of the internal Haemorrhoids. I might also take Notice, that some Stones are endued with an Electrical or attractical Virtue.

My honoured friend Dr Tancred Robinson in his Manuscript <title>Itinerary of Italy</title>, relates the many various Figures he observ’d naturally delineated and drawn on several Sorts of Stones digged up in the Quarries, Caves and Rocks, about Florence, and other parts of Italy, not only representing Cities, Mountains, Ruins, Clouds, Oriental Characters, Rivers, Woods, Animals, but also some

*94 Plants (as Ivy, Mosses, Maiden-hair, Ferns, and such Vegetables as grow in those Places) so exactly design’d and impress’d upon several Kinds of Stones, as though some skilful Painters or Sculpturers had been working upon them. The Doctor observes also the wonderful
Diversity of Shapes and Colours that Oars and other fossils shoot into, resembling almost every Thing in Nature, for which it seems very difficult to him to assign any Cause or Principle. In the Pyrites alone he believes he himself may have seen at home and abroad above a hundred Vareties, and yet he confesses he has been but a rude Observer of them.

In the Diaphanous Fossils (as Ambers, Crystals, Agates, &c.) preserv’d in the Cabinets of the great Duke of Tuscany, Cardinal Chigi, Settali, Moscardi, and other Repositories or Musaeums of that Curious Country, he takes Notice of the admiral Diversity of Bodies included, and naturally imprison’d within them, as Flies, Spiders, Frogs, Locusts, Bees, Pismires, Gnats, Grashoppers, Drops of Liquor, Hair, Leaves, Rushes, Moss, Seeds, and other Herbage; which seem to prove them to have been once in a State of Fluidity. The Bononia Stone digg’d up in the Appenines is remarkable for its shining Quality. The Amianthus for its Incombustibility. The Oculus Mundi for its Motion and Change of Colour. The Lapis Nephriticus, Calaminaris, Ostiocolla, Aetites, &c. for their Medicinal Uses."

*95

I might spend much Time in the discoursing of the most strange and unaccountable Nature and Powers of the Loadstone, a Subject which hath exercis’d the Wits and Pens of the most acute and ingenious Philosophers; and yet the Hypotheses which they have invented to give an Account of its admirable phaenomena seems to me lame and unsatisfactory. What can we say of the subtlety, activity, and penetrancy of its Effluvia, which no Obstacle can stop or repel, but they will make their Way through all sorts of Bodies, firm and fluid, dense and rare, heavy and light, pellucid and opake? Nay, they will pass through a Vacuity or empty Space, at least devoid of Air and any other sensible Body. Its attractive Power of Iron was known to the Ancients: its Verticity and Direction to the Poles of the Earth is of later Invention; which, of how infinite Advantage it hath been to these two or three last Ages, the great Improvement of Navigation, and Advancement of Trade and Commerce, by rendering the remotest Countries easily accessible; the noble Discovery of a vast Continent or new World, besides a Multitude of unknown Kingdoms and Islands; the Resolving experimentally those ancient Problems of the Spherical Roundness of the Earth; of the Being of Antipodes, or the Habitableness of the Torrid Zone, and the Rendring the whole Terraqueueous Globe circumnavigable; do abundantly demonstrate: whereas formerly they were wont to coast it, and creep along the Shores, scarce daring to venture out of the Ken of Land,

*96

when they did, having no other Guide but the Cynosura or Pole-Star, and those near it, and in cloudy Weather none at all.

As for Metals, they are so many ways useful to Mankind, and those Uses so well known to all, that it would be lost Labour to say any Thing of them: Without the Use of these we could have nothing of Culture or Civility; no Tillage or Agriculture; no Reaping or Mowing; no Plowing or Digging, no Pruning or Lopping, Grafting or Incision; no mechanical Arts or Trades; no Vessels or Utensils of Household-stuff; no convenient Houses or Edifices, no Shipping or Navigation. What a Kind of barbarous and sordid life we must necessarily have lived, the Indians in the Northern Part of America are a clear Demonstration. Only it is remarkable, that those which are of most frequent and necessary Use, as Iron, Brass and Lead, are the most common and plentiful: Others that are more rare, may better be spar’d, yet are they thereby qualified to be made the common Measure and Standard of the Value.
of all other Commodities, and so serve for Coin or Money, to which Use they have been employ'd by all civil Nations in all Ages.

Now, of what mighty Importance the use of Money is to Mankind, the Learned and Ingenious Dr. Cockburn shews us, in the Second Part of his Essays concerning the Nature of Christian Faith, p. 88.

<quote>Whenever; saith he, the Use of Money began, it was an admirable Contrivance br rewarding and encouraging Industry,

*97
for carrying on Trade and Commerce certainly, easily, and speedily, for obliging all to imploy their various Parts and several Capacities for the common Good, and engaging every one to communicate the Benefit of his particular Labour without any Prejudice to himself. Covetousness indeed, or an inordinate Love of Money, is vicious, and the Root of much Evil, and ought to be remedied; but the Use of Money is necessary, and attended with manifold Advantages. Where Money has not yet taken Place, where the Use of it hath not yet been introduc'd, Arts and Sciences are not cultivated, nor any of those Exercises ply'd, which polite Mens Spirits, and which abate the Uneasiness of Life. Men there are brutish and savage, none mind any thing but Eating and Drinking, and the other Acts of brutal Nature; their Thoughts aspire no higher than merely to maintain their Life and Breath: Like the Beasts they walk abroad all the Day long, and range about from Place to Place, only to seek their Food. Whatever may be suppos'd to follow if all were acted with great Generosity and true Charity, yet according to the present Temper of Mankind it is absolutely necessary that there be some Method and Means of Commutation, as that of Money, for rendring all and every one mutually useful and serviceable.

Now Gold and Silver by their Rarity at wonderfully fitted and accommodated for this Use of Permutation for all Sorts of Commodities or making Money of: Whereas were they

*98
as common and easie to come by as Straw or Stubble, Sand or Stones, they would be of no more Use for Bartering and Commerce than these.

And here he goes on to shew the Wonderful Providence of God, in keeping up the Value of Gold and Silver, notwithstanding the vast Quantities which have been digg'd out of the Earth in all Ages, and so continuing them a fit Material to make Money of. For which I refer to the Book.

Of these, Gold is remarkable for its admirable Ductility and Ponderosity, wherein it excels all other Bodies hitherto known. I shall only add concerning Metals, that they do pertinaciously resist all Transmutation; and tho' one would sometimes think they were turn'd into a different Substance, yet do they but as it were lurk under a Larva or Vizzard, and may be reduc'd again into their natural Form and Complexions, in Dispite of all the Tortures of Vulcan or corrosive Waters. Note, That this was written above Thirty Years since, when I thought I had Reason to distrust whatever had then been reported or written to affirm the Transmutation of Metals one into another.

I shall omit the Consideration of other Minerals, and of Salts and Earths, because I have nothing to say of their Uses, but only such as refer to Man, which I cannot affirm to have been the sole or primary End of the Formation of them. Indeed, to speak in general of these
Terrestrial Inanimate Bodies, they having no such Organization of Parts as the Bodies of Animals,

*99

nor any so intricate variety of Texture, but that their production may plausibly be accounted for by an Hypothesis of Matter divided in minute Particles or Atoms naturally indivisible, of various but a determinate number of Figures, and perhaps also differing in Magnitude and these mov'd, and continually kept in Motion according to certain establish'd Laws or Rules; we cannot so clearly discover the Uses for which they were created, but may probably conclude, that among other Ends they were made for those for which they serve us and other Animals; as I shall more fully make out hereafter. It is here to be noted, That, according to our Hypothesis, the Number of the Atoms of each several Kind that is of the same Figure and Magnitude is not nearly equal, but there be infinitely more of some Species than of others, as of those that compound those vast Aggregates of Air, Water, and Earth, more abundantly than of such as make up Metals and Minerals: The Reason whereof may probably be, because those are necessary to the Life and Being of Man and all other Animals, and therefore must be always at Hand; these only useful to Man, and serving rather his Convenience than Necessities. The Reason why I affirm the minute component Particles of Bodies to be naturally indivisible by any Agent we can imploy (even Fire itself) which is the only Catholick Dissolvent, other Menstruums being rather Instruments than Efficients in all Solutions, apt by Reason of the Figure and Smalness of their

*100

Parts to cut and divide other Bodies (as Wedges cleave Wood) when actuated by Fire or its Heat, which else would have no Efficacy at all (as wedges have not, unless driven by a Beetle:) the reason, I say, I have already given; I shall now instance in a Body whose minute Parts appear to be indissoluble by the Force of Fire and that is common Water, which distil, boil, circulate, work upon how you will by Fire, you can only dissolve it into Vapour, which when the Motion ceases, easily returns into Water again; Vapour being nothing else but the minute Parts thereof, by Heat agitated and separated one from another. For another Instance, some of the most learn'd and experienc'd Chymists do affirm Quicksilver to be intransmutable, and therefore call it Liquoor aeternus. And I am of Opinion, that the same holds of all simple Bodies, that their component Particles are indissoluble, by any natural Agent.

We may here note the Order and Method that Metals and Minerals observe in their Growth, how regularly they shoot, ferment, and as it were vegetate and regenerate; Salts in their proper and constant Figures; as our ingenious Countryman Dr. Jordan observes at large in his Discourse of Barhs and Mineral Waters.

Of Vegetables or Plants.

I have now done with inanimate bodies both simple and mix'd. The Animate are,

First, Such as are endued only with a Vegetative

*101

Soul, and therefore commonly called Vegetables or Plants; of which if we consider either their Stature and Shape, or their Age and Duration, we shall find it wonderful; for why should some Plants rise up to a great Height, others creep upon the Ground, which perhaps may have equal seeds, nay the lesser Plant many Times the greater Seed. Why should each Particular so observe its Kind, as constantly to produce the same Leaf for Consistency,
Figure, Division, and Edging, and bring forth the same Kind of Flower, and Fruit, and Seed? and that tho' you translate it into a Soil which naturally puts forth no such Kind of Plant, so that it is some <gk>logos spermatikos</greek> <margin>Seminal form or vertue</m> which doth effect this or rather some intelligent plastick Nature; as we have before intimated: For what Account can be given of the Determination of the Growth and Magnitude of Plants from Mechanical Principles, of Matter mov'd without the Presidency and Guidance of some superiour Agent? Why may not Trees grow up as high as the Clouds or Vapours ascend; or if you say the Cold of the superiour Air checks them, Why may they not spread and extend their lateral Branches so far till their Distance from the Centre of Gravity depress them to the Earth, be the Tree never so high? How comes it to pass that tho' by Culture and Manure they may be highly improv'd, augmented to a double, treble, nay, some a much greater Proportion in magnitude of all their Parts; yet is this Advance restrain'd within certain Limits?

*102 There is a <latin>maximum quod sic</l> which they cannot exceed. You can by no Culture or Art extend a Fennel Stalk to the Stature and Bigness of an Oak: Then why Should some be very long-liv'd, others only Annual or Biennial? How can we imagine that any Laws of Motion can determine the Situation of the Leaves, to come forth by Pairs, or alternately, or circling the Stalk; the Flowers to grow singly, or in company and tufts, to come forth the Bosoms of the Leaves and Branches, or on the Tops of Branches and Stalks? the Figure of the Leaves, that they should be divided into so many Jags or Escallops, and curiously indented round the Edges; as also of the Flower-leaves, their Number and Site, the Figure and Number of the Stamina and their Apices, the Figure of the Stile and Seed-Vessel, and the number of Cells into which it is divided. That all this be done, and all these Parts duly proportion'd one to another there seems to be necessary some intelligent plastick Nature, which may understand and regulate the whole Oeconomy of the Plant: For this cannot be the Vegetative Soul, because that is material and divisible together with the Body; which appears, in that a Branch cut off of a Plant will take Root, and grow, and become a perfect Plant itself; as we have already observ'd. I had almost forgotten the Complication of the Seed-leaves of some Plants in the Seed, which is so strange, that one cannot believe it to be done by Matter, however mov'd by any Laws or Rules imaginable. Some of them being so

*103 close-plaited, and straitly folded up and thrust together within the Membranes of the Seed that it would puzzle a Man to imitate it, and yet none of the Folds sticking or growing together; so that they may easily be taken out of their Cafes, and spread and extended even with one's Fingers.

Secondly, if we consider each particular Part of a Plant, we shall find it not without its End or Use; the Roots, for its stability and drawing Nourishment from the Earth, the Fibre to contain and convey the Sap; besides which there is a large Sort of Vessels to contain the proper and specifick Juice of the Plant, and others to carry Air for such a Kind of Repiration as it needeth; of which we have already spoken. The outer and inner Bark in Trees serve to defend the Trunk and Boughs from the Excesses of Heat and Cold and Drought and to convey the Sap for the annual Augmentation of the Tree; for, in Truth, every Tree may in some Sense be said to be an annual Plant, both Leaf, Flower and Fruit, proceeding from the Coat that was superinduced over the Wood the last Year, which Coat also never beareth any more, but together with the old Wood serves as a Form or Block to sustain the succeeding annual Coat.
The Leaves before the *Gemma* or Bud be explicated to embrace, and defend the Flower and Fruit, which is even then perfectly form'd; afterwards to preserve the Branches, Flowers and Fruit from the Injuries of the Summer Sun, which would

*104*

too much parch and dry them, if they lay open and expos'd to its Beams without any Shelter: The Leaves, I say, qualifie and contemper the Heat, and serve also to hinder the too hasty Evaporation of the Moisture about the Root: *But the principal Use of the Leaves (as we learn of Seignior Malphigii*, Monsieur Perault*, and Monsieur Mariotte*) is to concoct and prepare the Sap for the Nourishment of the Fruit, and the whole Plant, not only that which ascends from the Root, but what they take in from without, from the Dew, moist Air and Rain. This they prove because many Trees, if despoil'd of their Leaves, will die; as it happens sometimes on Mulberry-Trees, when they are pluck'd off to feed Silk-Worms. And because if in Summer-Time you denude a Vine-Branch of its Leaves the Grapes will never come to maturity: But tho' you expose the Grapes to the Sun-Beams, if you pluck not off the Leaves, they will ripen notwithstanding. That there is a Regress of the Sap in Plants from above downwards, and that this descendent Juice is that which principally nourisheth both Fruit and Plant, is clearly proved by the Experiments of Seignior Malphigii*, and those rare ones of an ingenious Country Man or our own *Philosoph. Transact. Num. 187* Thomas Brotherton* Esquire, of which I Shall mention only one, that is, If you cut off a Ring of Bark from the Trunk of any Tree that Part of the Tree above the Barked Ring shall grow and increase in Bigness, but not that beneath.

*105*

But whether there be such a constant Circulation of the Sap in Plants as there is of the Blood in Animals, as they would from hence infer, there is some Reason to doubt. *But the principal Use of the Leaves (as we learn of Seignior Malphigii*, Monsieur Perault*, and Monsieur Mariotte*) is to concoct and prepare the Sap for the Nourishment of the Fruit, and the whole Plant, not only that which ascends from the Root, but what they take in from without, from the Dew, moist Air and Rain. This they prove because many Trees, if despoil'd of their Leaves, will die; as it happens sometimes on Mulberry-Trees, when they are pluck'd off to feed Silk-Worms. And because if in Summer-Time you denude a Vine-Branch of its Leaves the Grapes will never come to maturity: But tho' you expose the Grapes to the Sun-Beams, if you pluck not off the Leaves, they will ripen notwithstanding. That there is a Regress of the Sap in Plants from above downwards, and that this descendent Juice is that which principally nourisheth both Fruit and Plant, is clearly proved by the Experiments of Seignior Malphigii*, and those rare ones of an ingenious Country Man or our own *Philosoph. Transact. Num. 187* Thomas Brotherton* Esquire, of which I Shall mention only one, that is, If you cut off a Ring of Bark from the Trunk of any Tree that Part of the Tree above the Barked Ring shall grow and increase in Bigness, but not that beneath.

I might add hereto the pleasant and delectable cooling and refreshing Shade they afford in the Summer-Time; which was very much esteem'd by the Inhabitants of hot Countries, who always took great Delight and Pleasure to sit in the open Air, under shady Trees; Hence that Expression so often repeated in Scripture, of every Man's sitting under his own vine, and under his own Fig-Tree, where also they us'd to eat as appears by Abraham's entertaining the Angel under a Tree, and standing by them when they did eat, Gen. xviii. 8. Moreover, the Leaves of Planes are very beautiful and ornamental. That there is great Pulchritude and Comeliness of Proportion in the Leaves, Flowers and Fruits of Plants, is attested by the general Verdict of Mankind, as Dr. More and others well observe. The adorning and beautifying the Temples and Buildings in all Ages, is an evident and undeniable Testimony of this; for what is more ordinary with Architects than the taking in Leaves and Flowers and Fruitage for the garnishing of their Work; as the Roman the Leaves of *Acanthus Sat.* and the Jewish of Palm-Trees and Pomegranates: And these more frequently than any of the five regular Solids as being more comely and pleasant to behold. If any Man shall object, that Comeliness of Proportion

*106*

and Beauty is but a mere Conceit, and that all things are alike handsome to some Men who have as good Eyes as others; and that this appears by the Variation of Fashions, which doth so alter Mens Fancies, that what e'er-while seem'd very handsome and comely, when it is once worn out of Fashion appears very absurd, uncouth and ridiculous. To this I Answer, That Custom and Use doth much in those Things where little of Proportion and Symmetry shew themselves, or which are alike comely and beautiful, to disparage the one, and commend the other: But there are Degrees of Things; for ( that I may use Dr. More's words )
I dare appeal to any Man that is not sunk into so forlorn a Pitch of Degeneracy that he is as stupid to these Things as the basest Beasts, whether, for Example, a lightly-cut Tetraedrum, Cube or Icosaedrum have no more Pulchritude in them than any rude broken Stone lying in the Field or High-ways or, to name other solid Figures, which tho’ they be not regular, properly so call’d, yet have a Settled Idea and Nature, as a Cone, Sphere or Cylinder, whether the Sight of those do not more gratify the Minds of Men, and pretend to more Elegancy of Shape than those rude Cuttings or Chippings of Free-stone that fall from the Mason's Hands, and Serve for nothing, but to fill up the Middle of the Wall, as fit to be hid from the Eyes of Men for their Ugliness. And therefore it is observable, that if Nature shape any thing but near to this Geometrical Accuracy, that we take Notice of it with much Content and Pleasure, and greedily gather and treasure it up. As if it be but exactly round, as those spherical Stones found in Cuba, and some also in our own Land, or have but its Sides parallel, as those rhomboideal Selenites found near St. Ives in Huntingdonshire, and many other Places in England. Whereas ordinary Stones of rude and uncertain Figures we pass by and take no Notice of at all. But tho’ the Figure of these Bodies be Pleasing and agreeable to our Minds, yet (as we have already observ’d) those of the Leaves, Flowers and Fruits of Trees, more. And it is remarkable, that in the Circumscription and Complication of many Leaves, Flowers, Fruits, and Seeds, Nature affects a regular Figure. Of a Pentagonal or Quincuncial Disposition, <name>Thomas Brown of Norwich</name> produces several Examples in his Discourse about the Quincunx. And doubtless Instances might be given in other regular Figures, were Men but observant.

The Flowers serve to cherish and defend the first and tender Rudiments of the Fruit: I might also add the masculine or prolifick Seed contained in the Chives or Apices of the Stamina. These beside the Elegancy of their Figures, are many of them endued with splendid and lovely Colours, and likewise most grateful and fragrant Odours. Indeed such is the Beauty and Lustre of some Flowers, that our Saviour saith of the Lilies of the Field (which some, not without Reason, suppose to have been Tulips ) that <bib>Solomon in all his Glory was not arrayed like one of these.</bib>

And it is observ’d by <name>Spigelius</name> <margin>Isag. ad rem Herbariam</margin>, That the Art of the most skilful Painter cannot so mingle and temper his Colours, as exactly to imitate or counterfeit the native ones of the Flowers of Vegetables.

As for the Seeds of Plants, Dr. More <margin>Antidote against Atheism 1.2.c.6.</margin> esteems it an evident Sign of Divine Providence, that every Kind hath its Seed: For it being no neceifary Result of the Motion of the Matter, ( as the whole Contrivance of the Plant indeed is not) and it being of so great Consequence, that they have Seed for the Continuance and Propagation of their own Species, and also for the gratifying Man's Art, Industry and Necessities, (for much of Husbandry and Gardening lies in this) it cannot but be an Act of Counsel to furnish the several Kinds of Plants with their Seeds.

Now the Seed being so necessary for the Maintenance and Increase of the Several Species, it is worthy the Observation, what Care is taken to secure and preserve it, being in some doubly and trebly defended. As for Instance, in the Walnut, Almond, and Plumbs of all Sorts, we have first a thick pulpy Covering, then a hard Shell, within which is the Seed enclos’d in a double Membrane. In the Nutmeg another Tegument is added besides all these, viz. the Mace <1717>between the green Pericarpium and the hard Shell, immediately
enclosing the Kernel. Neither yet doth the exterior Pulp of the Fruit or Pericarpium serve only for the Defence and Security

*109

Security of the Seed, whilst it hangs upon the Plant; but after it is mature and fallen upon the Earth, for the Stercoration of the Soil, and Promotion of the Growth, though not the first Germination of the Seminal Plant. <margin>Agric.l.2.c.6</m> Hence (as <name>Petrus de Crescentiis</n> tells us) Husbandmen, to make their vines bear, manure them with Vine-leaves, or the Husks of express Grapes; and they observe those to be most fruitful, which are so manured with their own: Which Observation holds true also in all other Trees and Herbs. But Besides this Use of the Pulp or Pericarpium, for the Guard and Benefit of the Seed, it serves also by a secondary Intention of Nature in many Fruits for the Food and Sustenance of Man and other Animals.

Another Thing worthy the noting in Seeds, and argumentative of Providence and Design) is that pappose Plumage growing upon the Tops of some of them, whereby they are capable of being wafted with the Wind, and by that Means scatter'd and disseminated far and wide.

Furthermore, most Seeds having in them a Seminal Plant perfectly form'd, as the Young is in the Womb of Animals, the elegant Complication thereof in some Species is a very pleasant and admirable Spectacle; so that no Man that hath a Soul in him can imagine or believe it was so form'd and folded up without Wisdom and Providence. But of this I have spoken already.

*110

Lastly, The immense Smalness of some Seeds, not to be seen by the naked Eye, so that the number of Seeds produced at once in some one Plant; as for Example, Reedmace [<bot>Tipha Palustris</bot> Harts-Tongue, and many Sorts of Ferns may amount to a Million, is a convincing Argument of the infinite Understanding and Art of the Former of them.

And it is remarkable that such Mosses as grow upon Walls, the Roofs of Houses and other high Places, have Seeds so excessively small, that when shaken out of their Vessels they appear like Vapour or Smoke, so that they may either ascend of themselves, or by an easie impulse of the Wind be rais'd Up to the Tops of Houses, Walls or Rocks: And we need not wonder how the Mosses got thither, or imagine they sprung up spontaneously there.

I might also take Notice of many other Particulars concerning Vegetables, as First, That Because they are design'd for the Food of Animals, therefore Nature hath taken more extraordinaly Care, and made more abundant Provision for their Propagation and Encrease, so that they are multiplied and propagated not only by the Seed, but many also by the Root, producing Off-sets or creeping under Ground, many by Strings or Wires running above Ground as Strawberry, and the like, some by Slips of Cuttings, and some by several of these Ways. <1717>And for the Security of such Species as are produced only by Seed, it hath endured all Seed with a lasting Vitality, that if by Reason of

*111

excessive Cold, or Drought, or any other Accident, it happen not to Germinate the First Year it will continue its Foeundity, I do not say two or three, nor six or seven, but even twenty or thirty Years; and when the Impediment is remov'd, the Earth in fit Case and the Season proper, spring up, bear Fruit, and continue its Species. Hence it is that Plants are sometimes lost for a while in Places where they formerly abounded; and again, after some Years,
appear new: Lost either because the Springs were not proper for their Germination, or because the Land was fallow'd, or because Plenty of Weeds or other Herbs prevented their coming up, and the like, and appearing again when these Impediments are remov'd.<1717>

Secondly, That some Sorts of Plants, as Vines, all sorts of Pulse, Hops, Briony, all Pomiferous Herbs, Pumions, Melons, Gourds, Cucumbers, and divers other Species, that are weak and unable to raise or support themselves, are either endued with a faculty of twining about others that are near, or else furnish'd with Claspers and Tendrils, whereby, as it were with Hands, they catch Hold of them, and so ramping upon Trees, Shrubs, Hedges or Poles, they mount up to a great Height, and secure themselves and their fruit.

Thirdly, That others are armed with Prickles and Thorns, to secure them from the Browsing of Beasts, as also to shelter others that grow under them. Moreover they are hereby render'd very useful to Man, as if design'd by Nature to make both Quick and Dead Hedges *112 and Fences. The great Naturalist <name>Pliny</name> hath given an ingenious Account of the Providence and design of Nature in thus arming and fencing them in these Words <latin>Inde (speaking of Nature ) excogitavit aliquas aspectu hispidas, tactu truces, ut tantum non vocem ipsius Naturae fingentis illas, rationemque reddentis exaudire videamur, ne se depascat avida quadrupes, ne procaces manus rapiant, ne neglecta vestigia obterant, ne infidens ales infringat; his muniendo aculeis telisque armando, remediis ut salva ac tuta sint. Ita hoc quoque quod in iis odimus hominum causa excogitatum est.</l>

<1717>It is worthy the noting, That Wheat, which is the best Sort of Grain, of which the purest, most savory and wholesome Bread is made, is patient of both Extreams, Heat and Cold, growing and bringing its Seed to Maturity, not only in temperate Countries, but also on one Hand in the Cold and Northern, viz. Scotland, Denmark &c. on the other, in the hottest and most Southerly, as Egypt, Barbary, Mauritania, the East Indics, Guinea, Madagascar, &c. scarce refusing any Climate.

Nor is it less observable, and not to be commemorated without Acknowledgement of the Divine Benignity to us, that ( as <name>Pliny</name> rightly notes ) nothing is more fruitful than Wheat, <latin>Quod ei natura (saith he ) [rectius naturae Parens] tribuit, quod co maxime hominem alit, utpote cum e modio, si et aptum solum, quale in Byzacio Africae campo centeni quinquaginta modii reddentur. Misit ex eo loco Divo Augusto procurator *113 eius ex uno grano (vix credibile dictu ) 400 paucis minus germina: Misit et Neroni similiter 360 stipulas ex uno grano.</l>

“Which Fertility Nature ( he should have said, the Author of Nature) hath confer'd upon it, because it feeds Man chiefly with it. One Bushel, if sown in a fit and proper Soil, such as is Byzacium, a Field of Africa, yielding 150 of annual Encrease; Augustus’s Procurator sent him from that Place 400 within a few Blades springing from the same Grain: And to Nero were sent thence 360.”

If <name>Pliny</name> a Heathen could make this Fertility of Wheat argumentative of the Bounty of God to Man, making such plentiful Provision for him of that which is of most pleasant Taste and wholesome Nourishment, surely it ought not to be passed over by us Christians without Notice taking and Thanksgiving..</1717>

<margin>Dr. More Antid. l.2.c.6.</m>
As for the Signatures of Plants, or the Notes impressed upon them, as Indices of their Virtues, tho' some lay great Stress upon them, accounting them strong Arguments to prove that some understanding Principle is the highest Original of the Works of Nature; as indeed they were, could it certainly be made appear, that there were such Marks designedly set upon them; because all that I find mention'd and collected by Authors, seem to me to be rather fancied by Men, than design'd by Nature to signify or point any such Virtues or Qualities as they would make us believe. I have elsewhere, I think upon good Grounds, rejected them; and finding no Reason, as yet, to alter my Opinion, I shall not further insist on them:

<1717>Howbeit, I will not deny, but that the noxious and malignant Plants do many of them discover something of their Nature by the sad and melancholick Visage of their Leaves, Flowers and Fruit. And that I may not leave that Head wholly untouch'd, one Observation I shall add relating to the Virtues of Plants, in which I think there is something of Truth, that is, that there are, by the wise Disposition of Providence, such Species of Plants produc'd in every Country as are most proper and convenient for the Meat and Medicine of the Men and Animals that are bred and inhabit there: Insomuch that <name>Solemander</name> writes, that from the Frequency of the Plants that sprung up naturally in any Region, he could easily gather what Endemial Diseases the Inhabitants thereof were subject to: So in Denmark, Friesland, and Holland, where the Scurvy usually reigns, the proper remedy thereof, Scurvy-grass, doth plentifully grow.</1717>

Of Bodies endued with a sensitive Soul, or Animals.

I proceed now to the Consideration of Animate Bodies endu'd with a Sensitive Soul, call'd Animals. Of these I shall only make some general Observations, not curiously consider the Parts of each particular species, save only as they serve for Instances or Examples.

First of all, because it is the great Design of

*115

Providence to maintain and continue every Species, I shall take Notice of the great Care at abundant Provision that is made for the securing this End. <latin>Quanta ad eam rem vis, ut in suo quaeque genere permaneat?</latin> <name>Cicero</name>. Why can we imagine all Creatures should be made Male and Female but to this Purpose? Why should there be implanted in each Sex such a vehement an inexpugnable Appetite of Copulation? Why in viviparous Animals, in the Time of Gestation should the Nourishment be carried to the Embryon in the Womb, which at other Times goeth not that Way? When the Young is brought forth, how comes all the Nourishment then to be transfer'd from the Womb to the Breasts or Paps, leaving its former Channel, the Dam at such Time being, for the most Part lean and ill favour'd?

<1717>To all this I might add, as a great Proof and Instance of the Care that is taken, and Provision made for the preservation and Continuance of the Species, the lasting Foecundity of the Animal Seed or Egg in the Females of Man, Beasts and Birds. I say, the Animal Seed because it is to me highly probable, that the Females, as well of Beasts as Birds, have in them from their first Formation the Seeds of all the Young they will afterwards bring forth, which when they are all spent. and exhausted by what Means soever, the Animal becomes barren and effete. These Seeds in some Species of Animals continue fruitful, and apt to take Life by
the Admixture of the Male-Seed fifty Years or more, and in some Birds fourscore or an hundred.</1717>

*116

Here I cannot omit one very remarkable Observation I find in <name>Cicero</n>: Atque ut intelligamus (saith he) nihil horum esse fortutitum, sed haec omnia providae solertisque naturae, quae miltiplices foetus procreant, ut Sues, ut Canes, his mammrarum data est multitudo, quas easdem paucas habent eae bestiae quae paua gignunt. “That we may understands that none of these Things (he had been speaking of) is fortuitous, but that all are the Effects of provident and sagacious Nature; multiparous Quadrupeds, as Dogs, as Swine, are furnished with a Multitude of Paps: Whereas those Beasts which bring forth few, have but a few.”

That flying Creatures of the greater Sort, that is Birds, should all lay Eggs, and none bring forth live Young, is a manifest Argument of Divine Providence, designing thereby their Preservation and Security, that there might be the more Plenty of them; and that neither the Birds of Prey, the Serpent, nor the Fowler, should straiten their Generations too much. For if they had been viviparous, the Burden of their Womb, if they had brought forth any competent Number at a Time, had been so great and heavy, that their Wings would have fill'd them, and they become an easie Prey to their Enemies: Or, if they had brought but one or two at a Time, they would have been troubled all the Year long with feeding their Young, or bearing them in their Womb. Dr. More Antid. Atheism, I.2. c.9.

This Mention of feeding their Young puts

*117

me in mind of two or three considerable Observations referring thereto.

First, Seeing it would be for many reasons inconvenient for Birds to give Suck, and yet no less inconvenient, if not destructive, to the Chicken upon exclusion, all of a sudden to make so great a change in its Diet, as to pass from liquid to hard Food, before the Stomach be gradually consolidated, and by use strengthen'd and habituated to grind and concoct it, and its tender and pappy Flesh fitted to be nourish'd by such strong and solid Diet; and before the bird be by little and little accustom'd to use its Bill and gather it up, which at first it doth but very slowly and imperfectly; therefore Nature hath provided a large Yolk in every Egg, a great part whereof remaineth after the Chicken is hatch'd, and is taken up and enclos'd in its Belly, and by a Channel made on purpose receiv'd by degrees into the Guts, and serves instead of Milk to nourish the Chick for a considerable time; which nevertheless mean while feeds it self by the Mouth a little at a time and gradually more and more, as it gets a perfecter Ability and Habit of gathering up its Meat, and its Stomach is strengthened to macerate and concoct it, and its Flesh <sic>hardned and fitted to be nourish'd by it.

Secondly, That Birds which feed their Young in the Nest, tho' in all likelihood they have no ability of counting the number of them should yet (tho' they bring but one morsel of Meat at a time, and have not fewer (it may be)

*118

then seven or eight Young in the Nest together, which at the return of their Dams, do all at once with equal Greediness, hold up their Heads and gape) not omit or forget one of them, but feed them all; which, unless they did carefully observe and retain in Memory which they had fed, which not, were impossible to be done: this, I say, seems to me most strange and admirable, and beyond the Possibility of mere Machine to perform.
Another Experiment I shall add, to prove, that tho' Birds have not an exact Power of numbering, yet have they of distinguishing many from few, and knowing when they come near to a certain Number: And that is, that when they have laid such a Number of Eggs, as they can conveniently cover and hatch, they give over and begin to sit; not because they are necessarily determin'd to such a Number; for that they are not, as is clear, because they are an Ability to go on and lay more at their Pleasure. Hens, for example, if you let their Eggs alone, when they have laid fourteen or fifteen, will give over and begin to sit, whereas, if you daily withdraw their Eggs, they will go on to lay five times that Number: [Yet some of them are so cunning, that if you leave them but one Egg, they will not lay to it, but forsake their Nest.] This holds not only in domestick and mansuetu Birds, for then it might be thought the Effect of Cicuration or Institution, but also in the wild; for my honour'd friend Dr. Martin Lister inform'd me, that of

*119

his own Knowledge one and the same Swallow, by the subtracting daily of her Eggs, proceeded to lay nineteen successively, and then gave over; as I have elsewhere noted.

*120

Now that I am upon this Subject of the Number of Eggs, give me Leave to add a remarkable Observation referring thereto, viz. That Birds, and such oviparous Creatures, as are long-liv'd, have Eggs enough at first conceiv'd in them to serve them for many Years laying, probably for as many as they are to live, allowing such a Proportion for every Year, as will serve for one or two Incubations; whereas Insects, which are to breed but once, lay all their Eggs at once, have they never so many. Now, had these Things been govern'd by Chance, I see no Reason why it should constantly fall out so.</1717>

Thirdly, The marvellous speedy Growth of Birds that are hatch'd in Nests, and fed by the Old ones there, 'till they be fledg'd, and come almost to their full Bigness, at which Perfection they arrive within the short Term of about one Fortnight, seems to me an Argument of Providence, designing thereby their Preservation, that they might not lie long in a Condition expos'd to the Ravine of any Vermine that may find them, being utterly unable to escape or shift for themselves.

Another and no less effectual Argument may be taken from the Care and Providence us'd for the Hatching and Rearing their Young: And first, they search out a secret and quiet Place where they may be secure and undisturb'd in their incubation; then they make themselves Nests every one after his kind, that so their Eggs and Young may lie soft and warm, and their exclusion and growth be promoted. These Nests some of them so elegant and artificial, that it is hard for Man to imitate them and make the like. I have seen Nests of an Indian Bird so artificially compos'd of the Fibres, I think, of some Roots, so curiously interwoven and platted together, as is admirable to behold: Which Nests they hang on the end of the Twigs of Trees over the Water, to secure their Eggs and Young from the ravage of Apes and Monkeys, and other Beasts that might else prey upon them. After they have laid their Eggs, how silently and patiently do they fit upon them 'till they be hatch'd, scarce affording themselves time to go off to get them Meat? Nay, with such an ardent and impetuous desire of sitting are they inspir'd, that if you take away all their eggs, they will sit upon an empty Nest: And yet one would think that sitting were none of the most pleasant Works.
After their Young are hatch'd, for sometimes they do almost constantly brood them under their Wings, lest the Cold and sometimes perhaps the Heat should harm them. All this while also they labour hard to get them Food, sparing it out of their own Bellies, and pining themselves almost to death rather than they should want. Moreover it is admirable to observe, with what courage they are at that time inspir'd, that they will even venture their own Lives in defence of them. The most timorous, as Hens and Geese become then so courageous, as to dare to fly in the Face of a Man that shall molest or disquiet their Yotmg, which would never do so much in their own defence. These things being contrary to any motions of Sense, or instinct of self-preservation, and so eminent pieces of self-denial, must needs be the Works of Providence, for the continuation of the Species and upholding of the World:

Especially if we consider that all these pains is bestow'd upon a thing which takes no notice of it, will render them no thanks for it, nor make them any requital or amends; and also, that after the Young is come to some growth, and able to shift for it self, the old one retains no such zorgE to it, takes no further care of it, but will fall upon it, and beat it indifferently with others.

To these I shall add three Observations more relating to this Head.

The first borrow'd of Dr. Cudworth, System, pag. 69. One thing necessary to the Conservation of the Species of Animals; that is, the keeping up constantly in the World a due numerical Proportion between the Sexes of Male and Female, doth necessarily infer a superintending Providence. For did this depend only upon Mechanism, it cannot well be conceived, but that in some Ages or other there should happen to be all Males or all Females, and so the Species fail. Nay, it cannot well be thought otherwise, but that there is in this a Providence, superior to that

*122 of the Plastick or Spermatick Nature, which hath not so much of Knowledge and Discretion allow'd to it, as whereby to be able <1691 text="alone"> to govern this Affair.

<1717>The Second of Mr. Boyle, in his <title>Treatise of the high Veneration Man’s Intellect owes to God</title>, p. 32. that is, the Conveniency of the Season ( or Time of Year ) of the Production of Animals, when there is proper Food and Entertainment ready for them. <quote>So we see, that, according to the usual Course of Nature, Lambs, Kids, and many other living Creatures, are brought into the World at the Spring of the Year; when tender Grass and other Nutritive Plants, are provided for their Food. And the like may be observ'd in the Production of Silk-worms, (yea, all other Eruca's, and many Insects more) whose Eggs, according to Nature's Institution, are hatch'd when Mulberry-Trees begin to bud, and put forth those Leaves, whereon those precious Insects are to feed: The Aliments being tender, whilst the Worms themselves are so, and growing more strong and substantial, as the Insects encrease in Vigour and Bulk.</quote>

To these I shall add another Instance, that is of the Wasp, whose Breeding is deterr'd 'till after the Summer-Solstice, few of them appearing before July: Whereas one would be apt to think the Vigorous and <sic>quickning Heat of the Sun in the Youth of the Year would provoke them to generate much sooner: [ Provoke them, I say, because every Wasps-Nest is begun by one great Mother-Wasp which over-lives the Winter, lying hid
in some hollow Tree or other Latibulum; because then, and not till then, Pears, Plumbs and other Fruit, design'd principally for their Food, begin to ripen.

The Third is mine own, That all Infects which do not themselves feed their Young nor treasure up Provision in Store for their Sustenance, lay their Eggs in such Places as are most convenient for their Exclusion, and where when hatch'd, their proper Food is ready for them: So, for example, we see two sorts of white Butterflies fastening their Eggs to. Cabbage Leaves, because they are a fit Aliment for the Catterpillers that come of them; where should they affix them to the Leaves of a Plant improper for their Food, such Caterpillers must needs be lost, they chusing rather to die that to taste of such Plants: For that Kind of Insect (I mean Catterpillers) hath a nice and delicate Palate, some of them feeding only upon one particular Species of Plant, others on divers indeed, but those of the same Nature and Quality; utterly refusing them of a contrary.

Like Instances might be produced in the other Tribes of Insects; it being perpetual in all, if not hinder'd or imprison'd, electively to lay their Eggs in Places where they are seldom lost or miscarry, and where they have a Supply of Nourishment for their Young so soon as they are hatch'd, and need it. Whereas should they scatter them carelessly and indifferently in any Place, the greatest Part of the Young would all in Likelihood perish soon after their Exclusion.

for want of Food, and so their Numbers continually decreasing, the whole Species in a few Years in danger to be lost: Whereas no such thing, I dare say, hath happened since the first Creation.

It is here very remarkable, that those Insects, for whose Young Nature hath not made provision of sufficient Sustenance, do themselves gather and lay up in store for them. So for example: The Bee, the proper Food of whose Eulae <margin>Bee-maggot</m> is Honey, or perchance Erithace, (which we english Bee-Bread) neither of which Viands is any where to be found amass'd by Nature in quantities sufficient for their maintenance, doth her self with unwearied diligence and industry, flying from Flower to Flower, collect and treasure them up.

To these I shall now add an Observation of Mr. Lewenhoeck's, concerning the sudden growth of some sorts of Insects, and the Reason of it.

It is (saith he) a wonderful thing, and worthy the Observation in Flesh-Flies, that a Fly-Maggot, in five days space after it is hatch'd arrives at its full growth and perfect magnitude. For if to the perfeccting of it there were requir'd, suppose a Months time or more, (as in some other Maggots is needful) it is impossible that about the Summer-Solstice any such Flies should be produc'd; because the Fly-Maggots have no ability to search out any other Food than that wherein they are placed by their Dams. Now this Food, suppose it be Flesh, Fish, or the Entrails of Beasts lying in the fields, expos'd to the hot Sun-beams, can last but a few Days in case and condition to be a fit Aliment for these Creatures, but will soon be quite parch'd and dry'd up. And therefore the most Wise Creator hath given such a Nature and Temperament to them, that within a very few days they attain to their full growth and magnitude. Whereas on the contrary, other Maggots, who are in no such danger of being straitned sor Food, continue a
whole Month or more before they give over to eat, and cease to grow. He proceeds further to tell us, that some of these Fly-Maggots which he fed daily with fresh Meat, he brought to perfection in four days time; so that he conceives that in the heat of Summer the Eggs of a Fly, or the Maggots contain'd in them, may in less than a Month's space run thro' all their changes, and come to perfect Flies, which may themselves lay Eggs again. 

Secondly, I shall take notice of the various strange Instincts of Animals; which will necessarily demonstrate, that they are directed to Ends unknown to them, by a wise Superintendent.

As, 1. That all Creatures shoul know how to defend themselves, and offend their Enemies; where their natural Weapons are situate, and how to make use of them. A Calf will so manage his Head as tho' he would push with his Horns even before they shoot. A Boar knows the use of his Tushes; a Dog his Teeth; a Horse of his Hoofs; a Cock of his Spurs; a Bee of her Sting; a Ram will butt with his Head, yea tho' he be brought up tame, and never saw that manner of Fighting. Now, why another Animal which hath no Horns should not make a Shew of pushing, or no Spurs, of striking with his Legs, and the like, I know not, but that every Kind is providentially directed to the Use of its proper and natural Weapons.

2. That those Animals that are weak, and have neither Weapons nor Courage to fight, are for the most Part created swift of Foot or Wing, and so being naturally timorous, are both willing and able to save themselves by Flight.

3. That Poultry, Partridge, and other Birds, should at the first Sight know Birds of Prey, and make Sign of it by a peculiar Note of their Voice to their Young, who presently thereupon hide themselves: That the Lamb should acknowledge the Wolf its Enemy, tho' it had never seen one before, as is taken for granted by most Naturalists, and may, for ought I know, be true, argues the Providence of Nature, or more truly the God of Nature, who, for their Preservation hath put such an Instinct into them.

4. That young Animals, so soon as they are brought forth, should know their Food: As for Example; such as are nourish'd with Milk presently find their Way to the Paps, and suck at them, whereas none of those that are not destin'd for that Nourishment ever offer to suck or seek out any such Food.

Again, 5. That such Creatures as are whole-footed, or Fin-toed viz. some Birds, and Quadrupeds, are naturally directed to go into the Water, and swim there,

*126 with his Head, yea tho' he be brought up tame, and never saw that manner of Fighting. 

*127 as we see Ducklings, tho' hatch'd and led by a Hen, if she brings them to the Brink of a River or Pond of Water, they presently leave her, and in they go, tho' they never saw any such Thing done before; and tho' the Hen clucks and calls, and doth what she can to keep them out: <name>Pliny</name> taketh Notice of, Hist. Nat. lib. 10. cap. 55. in these Words, speaking of Hens: <latin>Super omnia est Anatum Ovis subditis atq; exclusis admiratio, primo non plane agnoscentis foetum: mox incertos incubitas solicite convocantis: Postremo lamenta circa piscinae stagna, mergentibus se pullis natufa duce.</latin>
So that we see every Part in Animals is fitted to its Use, and the Knowledge of this Use put into them: For neither do any Sort of web-footed Fowls live constantly upon the Land, or fear to enter the Water, nor any Land-Fowl so much as attempt to swim there.

6. Birds of the same Kind make their Nests of the same Materials, laid in the same Order, and exactly of the same Figure; so that by the Sight of the Nest one may certainly know what Bird it belongs to. And this they do, tho' living in distant Countries, and tho' they never saw, nor could see any Nest made, that is, tho' taken out of the Nest and brought up by Hand; neither were any of the same Kind ever observ'd to make a different Nest, either for Matter or Fashion. This, together with the curious and artificial Contexture of such Nests, and their Fitness and Convenience for the Reception, Hatching, and Cherishing the

*128
Eggs and Young of their respective Builders, (which we have before taken notice of) is a great Argument of a Superior Author of their and other Natures, who hath endu'd 'em with these Instincts, whereby they are as it were acted and driven to bring about Ends which themselves aim not at, (so far as we can discern) but are directed to; for (as <name>Aristotle</name> observes <greek>oute teknE oute EtEsanta oute boulousamenapoiei</greek> They act not by any Art, neither do they enquire, neither do they deliberate about what they do. And therefore, as Dr. Cudworth saith well, they are not Masters of that Wisdom according to which they act, but only passive to the Instincts and Impresses thereof upon them. And indeed to affirm that brute Animals do all these things by a Knowledge of their own and which themselves are Masters of, and that without Deliberation and Consultation) were to make them to be endu'd with a most perfect Intellect far transcending that of Human Reason: Whereas it is plain enough, that Brutes are not above Consultation, but below it; and that these Instincts of Nature in them are nothing but a kind of Fate upon them.

<1717>The migration of Birds from an hotter to a colder Country, or a colder to an hotter, according to the Seasons of the Year, as their Nature is, I know not how to give an account of, it is so strange and admirable. What moves them to shift their Quarters? You will say, the disagreeableness of the temper of the Air to the constitution of their Bodies, or want of Food.

*129
But how come they to be directed to the same Place yearly, though sometimes but a little Island, as the Soland Goose to the Basse of Edinburgh Frith, which they could not possibly see, and so it could have no Influence upon them that way? The Cold or the Heat might possibly drive them in a right Line from either, but that they should impel Land-Birds to venture over a wide Ocean, of which they can see no End, is strange and unaccountable: One would think that the sight of so much Water and present fear of drowning should overcome the Sense of Hunger, or disagreeableness of the Temper of the Air. Besides, how come they to steer their Course aright to their several Quarters, which before the Compass was invented was hard for a Man himself to do, they being not able, as I noted before, to see them at that Distance? Think we that the Quails for Instance, could see quite across the Meditternowne Sea? And yet, it's clear, they fly out of Italy into Africk, lighting many times on Ships in the Midst of the Sea, to rest themselves when tir'd and spent with flying. That they should thus shift Places, is very convenient for them, and accordingly we see they do it; which seems to be impossible they should, unless themselves were endu'd with Reason, or directed and acted by a superior intelligent Cause.
The like may be said of the migration of divers Sorts of Fishes. As for Example; The
Salmon, which from the Sea yearly ascends up a River sometimes 400 or 500 Miles, only to cast their Spawn, and Secure it in Banks of Sand, for the preservation of it 'till the Young be hatch'd or excluded, and then return to Sea again. How these Creatures when they have been wandring a long time in the wide Ocean, should again find out and repair to the Mouths of the same Rivers, seems to me very strange, and hardly accountable, without recourse to Instinct, and the Direction of a Superior Cause.

That Birds, seeing they have no Teeth for the Mastication and preparation of their Food, should for the more convenient comminution of it in their Stomachs or Gizzards, swallow down little Pebble-stones, or other hard Bodies, and because all are not fit or proper for that use, should first try them in their Bills, to feel whether they be rough or angular, for their turns; which if they find them not to be, they reject them. When these by the working of the Stomach are worn smooth, or too small for their use, they avoid them by siege, and pick up others. That these are of great use to them for the grinding of their Meat, there is no doubt. And I have observ'd in Birds, that have been kept up in Houses, where they could get no Pebbles, the very Yolks of their Eggs have changed colour, and become a great deal paler, than theirs who have had their liberty to go abroad.

Besides, I have observed in many Birds, the Gullet, before its entrance into the Gizzard, to be much dilated, and thick set, or as it were granulated, with a Multitude of Glandules each whereof was provided with its excretory Vessel, out of which, by an easie pressure, you might squeeze a Juice or Pap, which serve, for the same Use which the Saliva doth in Quadrupeds; that is, for the macerating and dissolution of the Meat into a Chyle. For that the Saliva, notwithstanding its insipidness, has a notable Virtue of macerating and dissolving Bodies, appears by the effects it hath in killing of Quicksilver, fermenting of Dough like Leaven or Yeast, taking away Warts, and curing other cutaneous Distempers; sometime exulcerating the Jaws, and rotting the Teeth.

Give me leave to add one particular more concerning Birds, which some may perchance think too homely and indecent to be mentioned in such a Discourse as this; yet because it is not below the Providence of Nature, and designed for Cleanliness, and some great Men have thought it worth the observing, I need not be asham'd to take notice of it; that is, that in young Birds that are fed in the Nest, the Excrement that is avoided at one time is so viscid, that it hangs together in a great lump as if it were inclosed in a Film, so that it may easily be taken up, and carried away by the old Bird in her Bill. Besides, by a strange instinct, the young Bird elevates her hinder parts so high, for the most part, that she seldom fails to cast what comes from her clear over the side of the Nest. So we see here is a double provision made to keep the Nest clean, which, if it were defiled with Ordure, the Young Ones must necessarily be utterly marred and ruined.</1717>

7. The Bee, a Creature of the lowest forms of Animals, so that no Man can suspect it to have any considerable Measure of Understanding, or to have Knowledge of, much less to aim at any End, yet makes her Combs and Cells with that Geometrical Accuracy, that she must
needs be Acted by an Instinct implanted in her by the wise Author of Nature. For First, she plants them in a perpendicular Posture, and so close together as with conveniency they may, beginning at the Top, and working downwards, that so no room may be lost in the Hive, and that she may have easie Access to all the Combs and Cells. Besides, the Combs being wrought Double, that is, with Cells on each Side, a common Bottom or Partition-wall, could not in any other Site have so conveniently, if at all, received or contained the Honey. Then she makes the particular Cells most Geometrically and Artificially, as the famous Mathematician <name>Pappus</name> demonstrates in the Preface to his third Book of Mathematical Collections. First of all, (saith he, speaking of the Cells,) it is convenient that they be of such Figures as may cohere one to another, and have common sides, else there would be empty spaces left between them to no Use, but to the weakening and spoiling of the work, if any Thing should get in there. And therefore, tho' a round Figure be most capacious for the Honey

*133 and most convenient for the Bee to creep into, yet did he not make choice of that, because then there must have been triangular Spaces left void. Now there are only three rectilineous and ordinate Figures which can serve to this Purpose; and inordinate, or unlike ones, must have been not only less elegant and beau tiful, but unequal. [Ordinate Figures are such as have all their Sides, and all their Angles equal.] The three ordinate Figures are, Triangles, Squares and Hexagons. For the space about any Point may be filled up either by six equilateral Triangles or four Squares, or three Hexagons; whereas three Pentagons are too little, and three Heptagons too much. Of these three the Bee makes use of the Hexagon, both because it is more capacious than either of the other, provides they be of equal compass, and so equal matter spent in the Construcion of each: And Secondly, because it is most commodious for the Bee to creep into: And Lastly, because in the other Figures, more Angles and Sides must have met together at the same point, and so the Work could not have been so firm and strong. Moreover, the Combs being double, the Cells on each Side the Partition are so order'd, that the Angles on one Side, insist upon the Centers of the bottoms of the Cells on the other Side, aml not Angle upon, or against Angle; which also must needs contribute to the Strength and Firmness of the Work.

<1717>These Cells she fills with Honey for her Winter Provision and curiously closes them up with Covers of

*134 Wax, that keep the included Liquor from spilling, and from external Injuries, as Mr. Boyle truly observes, Treatise of Final Causes, p.169</1717>

Another sort of Bee, I have observed, may be called the Tree-Bee, whose Industry is admirable in making provition for her young. First, she digs round Vaults or Burrows [Cuniculosl in a rotten or decayed Tree, of a great length, in them she builds or forms her cylindrical Nest or Cases resembling Cartrages, or a very narrow Thimble, only in proportion longer, of pieces of Rose or other Leaves, which she shares off with her Mouth, and plats and joins close together by some glutinous Substance. These Cases she fills with a red Pap, of a thinner consistence than an Electuary, of no pleasant taste, which where she gathers, I know not:

<1717>And which is most remarkable, she forms these Cases, and stores them with this Provision, before she hath any young one hatch'd, or so much as an Egg laid.</1717>
For on the top of the Pap she lays one Egg, and then closes up the Vessel with a cover of Leaves. The enclos'd Egg soon becomes an Eula, or Maggot, which feeding upon the Pap till it comes to its full growth, changes to a Nympha, and after comes out a Bee.

Another Insect noted for her seeming Prudence, in making provision for the Winter, proposed by Solomon to the Sluggard for his imitation, is the Ant, which (as all Naturalists agree) hoards up Grains of Corn against the Winter for her Sustenance:

*135
And is reported by some Pliny l.11.c.30. to bite off the germen of them, lest they should sprout by the Moisture of the Earth, which I look upon as a mere fiction; neither should I be forward to credit the former Relation, were it not for the Authority of the Scripture, because I could never observe any such storing up of Grain by our Country-Ants.

Yet there is a Quadruped taken notice of even by the Vulgar for laying up in Store Provision for the Winter, that is, the squirrel, whose Hoards of Nuts are frequently found, and pillaged by them.

The Beaver is by credible Persons, Eye-witnesses, affirm'd to build him Houses for shelter, and security in Winter-time: See Mr Boyle of Final Causes, p. 173.

Besides these I have mention'd, an hundred others may be found in Books relating especially to Physick, as, that Dogs when they are sick, should vomit themselves by eating Grass: That Swine should refuse Meat so soon as they feel themselves ill, and so recover by Abstinence: That the Bird Ibis should teach Men the Way of administering Clysters, Pliny lib. 8. cap. 27. The wild Goats of Dictamus for drawing out of Darts, and healing Wounds: The Swallow the use of Celandine for repairing the Sight, &c. ibid. Of the Truth of which because I am not fully satisfied, I shall make no Inference from them.

Thirdly, I shall remark the Care that is taken for the Preservation of the Weak and such as are exposed to injuries, and preventing the encrease of such as are noisome and hurtful: for as it is a Demonstration of the Divine Power and Magnificence to create such Variety of Animals, not only great but small, not only strong and couragious, but also weak and timorous; so is it no less Argument of his Wisdom to give to these Means, and the Power and Skill of using them, to preserve themselves from the Violence and Injuries of those. That of the weak some should dig Vaults and Holes in the Earth, as Rabbets, to secure themselves and their young; others should be arm'd with hard Shells; others with Prickles, the rest that have no such Armature, should be endued with great Swiftness or Pernicity: And not only so, but some also have their Eyes stand so prominent, as the Hare, that they can see as well behind as before them, that so they may have their Enemy always in their Eye; and long, hollow, moveable ears, to receive and convey the least Sound, or that which comes from far, that they be not suddenly surprised or taken (as they say) Napping.

Moreover, it is remarkable, that in this Animal, and in the Rabbet, the Muscles of the Loyns and Hind-legs are extraordinarily large in Proportion to the rest of the Body, or those of other Animals, as if made on Purpose for swiftness, that they may be able to escape the Teeth of so many Enemies as continually pursue and chase them. Add hereto the Length of their Hind-legs, which is no

*137
small Advantage to them, as is noted by Dame <name>Julan Barns</name>, in an ancient Dialogue in Verse between the Huntsman and his Man; the Man there asks his Master, What is the Reason, why the Hare when she is near spent makes up a Hill; The Master Answers, That Nature hath made the Hinder-legs of the Hare longer than the Fore-legs; by which Means she climbs the Hill with much more ease than the Dogs, whose Legs are of equal length, and so leaves the Dogs behind her, and many Times escapes away clear, and saves her Life. This last Observation, I must confess my self to have borrowed out of the Papers of my honoured friend Mr. John Aubrey, which he was Pleased to give me a Sight of.

I might here add much concerning the Wiles and Ruses, which these timid creatures make use of to save themselves, and escape their Persecutors but that I am somewhat diffident of the Truth of those Stories and Relations, I shall only aver what myself have sometimes observ'd of a Duck, when closely pursued by a Water-dog; she not only dives to save herself (which yet she never does but when driven to an exigent, and just ready to be caught because it is Painful and Difficult to her) but when she comes up again, brings not her whole Body above Water but only her Bill, and Part of her Head, holding the Rest underneath, that so the Dog, who the mean Time turns round and looks about him, may not espy her, 'till she have recover'd Breath.

*138

As for Sheep, which have no natural Weapons or Means to defend or secure themselves, neither Heels to run, nor Claws to dig; they are deliver'd into the Hand, and committed to the Care and Tuition of Man, and Serving him for divers Uses, are nourished and protected by him; and so enjoying their Beings for a Time, by this Means propagate and continue their Species: So that there are none destitute of some Means to preserve themselves, and their Kind; and these Means so effectual that notwithstanding all the Endeavours and Contrivances of Man and Beast to destroy them, there is not to this Day one Species lost of such as are mention'd in Histories, and consequently and undoubtedly neither of such as were at first created.

Then for Birds of Prey, and rapacious Animals, it is remarkable what <name>Aristotle</name> observes, That they are all solitary, and go not in Flocks, <greek>GampsOnuchOn uden agelaion</greek>. No Birds of Prey are gregarious. Again, That such Creatures do not greatly multiply, <greek>tOn gampsOnuchOn</greek>. They for the most Part breeding, and bringing forth but one or two, or at least a few Young Ones at once: Whereas they that are feeble and timorous are generally Multiparous; or, if they bring forth but few at once, as Pigeons, they compensate that by their often breeding, viz. every Month but two throughout the Year; by this Means providing for the Continuation of their Kind.

*139

But for the Security of these rapacious Birds, it is worthy the noting that because a Prey is not always ready, but perhaps they may fail of one some Days; Nature hath made them patient of a long inedia, and besides, when they light upon one, they gorge themselves so therewith, as to suffice for their Nourishment for a considerable Time.

Fourthly, I shall note the exact fitness of the Parts of the Bodies of Animals to every one's Nature and Manner of Living. A notable Instance of which we have in the Swine, a Creature well known, and therefore what I shall observe of it is obvious to every Man. His proper and natural Food being chiefly the Roots of Plants, he is provided with a long and strong Snout; long, that he might thrust it to a sufficient Depth into the Ground, without offence to his Eyes; strong and conveniently formed for the rooting and turning up the
Ground. And besides, he is endued with a notable Sagacity of Scent, for the finding out such Roots as are fit for his Food. Hence in Italy, the usual Method for finding and gathering of Truffles, or subterraneous Mushromes (called by the Italians Tartusali, and in Latin Tubera terrae) is by tying a Cord to the Hind-leg of Pig, and driving him before them into such Pastures as usually produce that Kind of Mushrome, and observing where he stops and begins to root, and there digging, they are sure to find a Truffle; which when they have taken up, the drive away the Pig to search for more. So I have myself observed, that in Pastures where there are Earth-nuts to be found up and down

*140

in several Patches, tho' the Roots lie deep in the Ground, and the stalks be dead long before and quite gone, the Swine will by their Scent easily find them out, and root only in those Places where they grow.

This rooting of the Hog in the Earth, calls to mind another Instance of like Nature, that is the Porpesse, which as his English Name Porpesse, i.e. Porc pesce, <margin>Swine-fish</m> imports, resembles the Hog, both in the Strength of his Snout, and also in the Manner of getting his Food by rooting. For we found the Stomach of one we dissected, full of Sand-Eels or Launces, which for the most Part lie deep in the Sand, and cannot be gotten but by rooting or digging there. We have seen the Country People in Cornwall, when the Tide was out, to fetch them out of the Sand with Iron-hooks thrust down under them, made for that Purpose.

Furthermore, That very Action for which the Swine is abominated, and looked upon as an unclean and impure Creature, namely wallowing in the Mire, is Design'd by Nature for a very good End and Use, viz. not only to cool his Body, for the fair Water would have done that as well, nay, better, for commonly the Mud and Mire in Summer-time is warm; but also to suffocate and destroy Lice, Fleas, and other noisom and importunate Insects, that are troublesome and noxious to him. For the same Reason do all the Poultry-kind, and divers other Birds bask themselves in the Dust in Summer

*141
time and hot Weather, as is obvious to every one to observe.

2. A Second and no less remarkable Instance, I shall produce, out of Dr. More's Antidote against Atheism, lib. 2. cap. 10. in a poor and contemptible quadruped, the Mole.

First of all (saith he) her Dwelling being under Ground, where nothing is to be seen, Nature hath so obscurely fitted her with Eyes that Naturalists can scarcely agree, whether she hath any Sight at all or no. [In our Observation, Moles have perfect Eyes, and Holes for them through the Skin, so that they are outwardly to be seen by any that shall diligently search for them; tho' indeed they are exceeding small, not much bigger than a great Pins-head. But for amends, what she is capable of for her Defence and warning of Danger, she has very eminently conferr'd upon her; for she is very quick of hearing [doubtless her subterraneous Vaults are like Trunks to convey any Sound a great Way.] And then her short Tail and short Legs, but broad Fore-feet armed with sharp Claws, we see by the Event to what purpose they are, she so swiftly working herself under Ground, and making her Way so fast in the Earth, as they that behold it cannot but admire it. Her Legs therefore are short, that she need dig no more than will serve the meer thickness of her Body: And her Fore-feet are broad, that she may scoup away much Earth at a Time: And she has little or no Tail, because she courses it not on the Ground like a Rat or Mouse, but lives under the Earth,
and is fain to dig herself a Dwelling there; and she making her way through so thick an Element; which will not easily yield as the Water and Air do; it had been dangerous to draw so long a Train behind her; for her Enemy might fall upon her Rear, and fetch her out before she had perfected and got full Possession of her Works: Which being so, what more palpable Argument of Providence than she?

Another Instance in Quadrupeds might be the Tamandua, or Ant-Bear, described by <name>Marcgrave</name> and <name>Piso</name>, who saith of them, that they are Night-walkers, and seek their Food by Night. Being kept tame, they are fed with Flesh, but it must be minced small, because they have not only a slender and sharp Head and Snout, but also a narrow and toothless Mouth; their Tongue is like a great Lute-string (as big as a Goose-quill) round, and in the greater Kind (for there are two Species) more than two Foot long, and therefore lies doubled in a Channel between the lower Parts of the Cheeks. This when hungry they thrust forth, being well moistened, and lay upon the Trunks of Trees and when it is covered with Ants, suddenly draw it back into their Mouths; if the Ants lie so deep that they cannot come at them, they dig up the Earth with their long and strong Claws, wherewith for that Purpose their Fore-feet are armed. So we see how their Parts are fitted for this Kind of Diet, and no other; for the catching of it, and for the eating of it, it requiring no Comminution by the Teeth, as appears also in the Chamaeleon, which is another Quadruped that imitates the Tamandua in this Property of darting out the Tongue to a great Length, with wonderful Celerity; and for the same Purpose too of catching of Insects.

Besides these Quadrupeds, there are a whole Genus of Birds, called Pici Martii, or Woodpeckers, that in like Manner have a Tongue which they can shoot forth to a very great Length, ending in a sharp stiff bony Rib, dented on each Side; and at Pleasure thrust it into the Holes, Clefts, and Crannies of Trees to stab and draw out Cossi, or any other Insects lurking there, as also into Ant-hills, to strike and fetch out the ants and their Eggs. More over, they have short, but very strong Legs and their Toes stand two forwards, two backwards, which Disposition (as <name>Aldrovandus</name> well notes) Nature, or rather the Wisdom of the Creator, hath granted to Woodpeckers because it is very convenient for the climbing of Trees, to which also conduces the stiffness of the Feathers of their Tails, and their bending downward, whereby they are fitted to serve as a Prop for them to lean upon, and bear up the Bodies.

As for the Chamaelion, he imitates the Woodspite, not only in the Make, Motion, and Use of his Tongue for striking Ants, Flies, and other Insects; but also in the Site of his Toes, whereby he is wonderfully qualified to run upon Trees, which he doth with that swiftness, that one would think he flew, whereas upon the Ground he walks very clumsily and ridiculously. A full Description of the outward and inward Parts of this Animal, may be seen at the End of <name>Panarolus</name>’s Observat. It is to be noted, that the Chamelion, tho’ he hath Teeth, uses them not for chewing his Prey, but swallows it immediately.

*I shall add two Instances more in Birds, and those are,

1. The Swallow; whose proper Food is small Beetles, and other Insects flying about in the Air; as we have found by dissecting the Stomachs both of Old Ones and Nestlings: Which is
wonderfully fitted for the catching of these Animalcules; for she hath long Wings, and a
forked Tail, and small Feet, whereby she is as it were made for swift Flight, and enabled to
continue long upon the Wing, and to turn nimbly in the Air. And she hath also an
extraordinary wide Mouth, so that it is very hard for any Insect that comes in her Way to
escape her. It is thought to be a Sign of Rain, when this Bird flies low near to the Ground;
in which there may be some Truth; because the Insects which she hunts may at such Times,
when the superior Air is charged with Vapours, have a Sense of it, and descend near the
Earth. Hence, when there are no more Insects in the Air; as in Winter-time, those Birds do
either abscond, or betake themselves into hot Countries.

*145
2. The Colymbi, or Douchers, or Loons, whose bodies are admirably fitted and conformed
for diving under Water: Being covered with a very thick Plumage; and the Superficies
of their Feathers so smooth and slippery, that the Water cannot penetrate or moisten them:
Whereby their Bodies are defended from the Cold, the Water being kept at a distance; and so
poised that by a light Impulse they may easily ascend in it. Then their Feet are situate in the
hindmost part of their Body, whereby they are enabled, shooting their Feet backwards, and
striking the Water upwards, to plunge themselves down into it with great Facility, and
likewise to move forwards therein. Then their Legs are made flat and broad, and their Feet
cloven into Toes with appendant Membranes on each side; by which Configuration they
easily cut the Water, and are drawn forward, and so take their Stroke backwards; and
besides, I conceive, that by means of this Figure, their Feet being mov'd to the Right and
Left-hand, serve them as a Rudder to enable them to turn under Water: For some conceive,
that they swim easier under Water than they do above it. How they raise themselves up
again, whether their Bodies emerge of themselves by their Lightness, or whether by Striking
against the Bottom, in manner of a leap, or by some peculiar motion of their Legs, I cannot
determine: That they dive to the Bottom is clear, for that in the Stomachs both of the greater
and lesser Kinds we found Grass and other Weeds; and in the lesser

*146
kind nothing else; though both prey upon Fish. Their Bills also are made streight and Sharp
for the easier cutting of the Water, and Striking their Prey. Could we see the Motions of
their Legs and Feet in the Water, then we should better comprehend how they ascend,
descend, and move to and fro; and discern, how wisely and artificially their Members are
formed and adapted to those Uses.</1717>

II. In Birds, all the Members are most exactly fitted for the use of flying. First, The Muscles
which serve to move the Wings are the greatest and strongest, because much Force is
required to the Agitation of them; the underside of them is also made Concave, and the
upper Convex, that they may be easily lifted up, and more strongly beat the Air, which by
this means doth more resist the descent of their Body downward. Then the Trunk of their
Body doth somewhat resemble the Hull of a Ship; the Head, the Prow, which is for the most
part small, that it may the more easily cut the Air, and make way for their Bodies; the Train
serves to steer, govern, and direct their Flight; and however it may be held erect in their
standing or walking, yet is directed to lie almost in the same plain with their Backs, or rather
a little inclining, when they fly. That the Train serves to steer and direct their Flight; and
turn their Bodies like the Rudder of a Ship is evident in the Kite, who by a light running of
his Train moves his Body which way

*147
he Pleases. <latin>Idem videntur artem gubernandi docuisse caudae flexibus,in Coelo
monstrante natura quod opus esset in profundo,</latin> <name>Pliny</name>. lib. 10. cap. 10.
They seem to have taught Men the Art of steering a Ship by the Flexures of their Tails; Nature shewing in the Air what was needful be done in the Deep.

And it's notable that as *Aristotle* truly observes, that whole-footed Birds, and those that have long Legs, have for the most part Short Tails; and therefore whilst they fly, do not, as others, draw them up to their Bellies, but stretch them at length backwards, that they may serve to steer and guide them instead of Tails. Neither doth the Tail serve only to direct and govern the flight but also partly to support the Body, and keep it even; wherefore, when spread, it lies parallel to the Horizon, and stands not perpendicular to it, as Fishes do. Hence Birds that have no Tails, as some sorts of Colymbi or Duckers fly very inconveniently with their Bodies almost erect.

<1717> To this I shall add further, That the Bodies of Birds are small in comparison of Quadrupeds, that they may more easily be supported in the Air during their Flight; which is a great Argument of Wisdom and Design: Else why should not we see Species of Pegasi, or Flying Horses, of Griffins, of Harpies, and an hundred more, which might make a shift to live well enough, notwithstanding they could make no use of their Wings. Besides, their Bodies are not only small, but of a broad Figure, that

*148* the Air may more resist their Descents, they are also hollow and light; nay, their very Bones are light: For though those of the Legs and Wings are solid and firm, yet have they ample Cavities, by which means they become more rigid and stiff; it being demonstrable that a hollow Body is more stiff and inflexible than a solid one of equal Substance and Matter. Then the Feathers also are very light, yet their Shafts hard and stiff, as being either empty or filled with a light and spungy Substance; and their Webs are not made of continued Membranes, for then had a Rupture by any Accident been made in them, it could not have been consolidated, but of two Series of numerous Plumulae, or contiguous Filaments, furnished all along with Hooks on each side, whereby catching hold on one another, they stick fast together; So that when they are ruffled or discomposed, the Bird with her Bill can easily preen them, and reduce them to their due Position again. And for their firmer Cohesion, the wise and bountiful Author of Nature hath provided and placed on the Rump two Glandules, having their excretory Vessels, round which grow Feathers in form of a Pencil, to which the Bird turning her Head, catches hold upon them with her Bill, and a little compressing the Glandules, squeezes out and brings away therewith an oily Pap or Liniment, most fit and proper for the Inunction of the Feathers, and causing their little Filaments more strongly to cohere. And is not this strange and admirable, and

*149* argumentative of Providence, that there should be such an Unguent or Pap prepared, such an open Vessel to excern it into, to receive and retain it; that the Bird should know where it is situate, and how, and to what Purposes to use it? And because the Bird is to live many Years and the Feathers in time would, and must necessarily be worn and shattered, Nature hath made Provision for the casting and renewing them Yearly.

Moreover, those large Bladders or Membranes, extending to the Bottoms of the bellies of Birds, into which the Breath is received, conduce much to the alleviating of the Body, and facilitating the Flight. For the Air received into these Bladders, is by the Heat of the Body extended into twice or thrice the Dimensions of the external, and so must needs add a Lightness to the Body. And the Bird when she would descend, may either compress this Air by the Muscles of the Abdomen, or expire as much of it as may enable her to descend swifter, or slower, as she pleases. I might add the Use of the Feathers in cherishing are
keeping of the Body warm; which, the Creature being of small bulk, must needs stand in
great stead against the Rigor of the Cold.

And for this Reason we see, that Water-Fowls, which were to swim, and sit long upon the
cold Water, have their Feathers very thick set upon their Breast and Bellies, and besides a
plentiful Down there growing, to fence against the Cold of the Water, and to keep off its
immediate Contact.

*150
That the Tails of all Birds in general do not conduce to their turning to the Right and Left,
according to the common Opinion, but rather for their Ascent and Descent, some modern
Philosophers have observed and proved by Experiment for that it you pluck off, for instance,
a Pigeon's tail, she will nevertheless with equal facility turn to and fro: Which upon second
Thoughts, and further Consideration, I grant to be true, in Birds whose Tails are pointed, and
end in a right Line: But in those that have forked Tails, Autopsy convinceth us, that it hath
this use; and therefore they pronounce too boldly of all in general. For it is manifest to sight,
that the fork’d-tail’d Kite, by turning her Train sideways, elevating one Horn, and
depressing the other, turns her whole Body. And doubtless the Tail hath the same use in
Swallows, who make the most sudden Turns in the Air of any Birds, and have all of them
forked Tails.</1717>

III. As for Fishes, their Bodies are long and slender, or else thin for the most part, for their
more easie swimming and dividing the Water. The Wind-bladder, wherewith most of them
are furnished, serves to poise their Bodies, and keep them equiponderant to the Water,
which else would sink to the bottom, and lie groveling there, as hath by breaking the
Bladder been experimentally found. By the Contraction and Dilatation of this Bladder, they
are able to raise or sink themselves at pleasure, and continue in what depth of Water they
will. The Fins made of gristly Spokes or Rays connected

*151
by Membranes, so that they may be contracted or extended like Womens Fans, and
furnished xwith Muscles for Motion, serve partly for Progression, but chiefly to hold the
Body upright; which appears in that when they are cut off, it wavers to and fro, and so soon
as the Fish dies, the belly turns upwards.

The great strength by which Fishes dart themselves forward with incredible Celerity, like an
Arrow out of a Bow, lies in their Tails, their Fins mean time, least they should retard their
motion, being held close to their Bodies. And therefore almost the whole Musculous Flesh
of the Body is bestow’d upon the Tail and Back, and serves for the Vibration of the Tail, the
Heaviness and Corpulency of the Water, requiring a great Force to divide It.

<1717>In Cetaceous Fishes; or as the Latins call them, Sea-Beasts, <margin>Belluae
Marinae</margin> the Tail hath a different Position from what it hath in all other Fishes; for
whereas in these it is erected perpendicular to the Horizon, in them it lies parallel thereto,
partly to supply the use of the hinder Pair of Fins which these Creatures lack, and partly to
raise and depress the Body at pleasure. For it being necessary that these Fishes should
frequently ascend to the top of the Water to breath, or take in and let the Air, it was fitting
and convenient that they should be provided with an Organ to facilitate their Ascent and
Descent as they had occasion. And as for their turning of their Bodies in the Water, they
must perform

*152
that as Birds do, by the Motion of one of their Fins, while the other is quiescent. It is no less remarkable in them, that their whole Body is encompassed round with a copious Fat, which our Fishermen call the Blubber, of a great Thickness; which serves partly to poise their Bodies, and render them equiponderant to the Water; partly to keep off the Water at some Distance from the Blood, the immediate Contact whereof would be apt to chill it, and partly also for the same Use that Cloaths serve us, to keep the Fish warm, by reflecting the hot Steams of the Body, and so redoubling the Heat, as we have before noted. For we see, by Experience, that fat Bodies are nothing near so sensible of the Imprevisions of Cold as lean. And I have observed fat Hogs to have lain abroad in the open Air, upon the cold Ground in Winter Nights, whereas the lean ones have been glad to creep into their Cotes, and lie upon Heaps to keep themselves warm.</p>

I might here take Notice of those Amphibious Creatures, which we may call Aquatic Quadrupeds (though one of them there is that hath but two Feet, viz. the Manati, or Sea-Cow) the Beaver, the Otter, the Phoca or Sea-Calf, the Water-Rat, and the Frog, the toes of whose Feet are joined by Membranees, as in Water-fowls for swimming; and who have very small Ears, and Ear-holes, as the Cetaceous Fishes have for hearing in the Water.

To this head belongs the adapting of the Parts that minister to Generation in the Sexes one to another; and in Creatures that nourish their Young with Milk, the Nipples of the Breast to the Mouth and Organs of Suction; which he must needs be wilfully blind and void of Sense, that either discerns not, or denies to be intended and made one for the other. That the Nipples should be made spungy, and with such Perforations, as to admit passage to the Milk when drawn, otherwise to retain it; and the Teeth of the Young either not sprung, or so soft and tender, as not to hurt the Nipples of the Dam, are Effects and Arguments of Providence and Design.

*A more full Description of the Breasts and Nipples I meet with, in a Book of that ingenious Anatomist and Physician, *Antonius Nuck*, entitled, *Adenographia Curiosa*, Cap. 2. He makes the Breasts to be nothing but Glandules of that Sort they call Conglomeratae, made up of an infinite Number of little Knots or Kernels, each whereof hath its excretor Vessel, or lactiferous Duct; three or four, or five of these presently meet, and join into one small Trunk; in like manner do the adjacent Glandules meet and unite; several of these lesser Trunks or Branches concurring, make up an Excretory Vessel of a notable Bigness, like to that of the Pancreas, but not so long, yet sufficiently large to receive and retain a good Quantity of Milk; which before it enters the Nipples is again contracted, and straitned to that Degree, that it will scarce admit a small Bristle. Who now can be so impudent as to deny, that all this was contrived and designed purposely to retain the Milk, that it should not flow out of its self, but easily be drawn out by pressure and function; or to affirm that this fell out accidentally than which there could not have been a more ingenious Contrivance for the Use to which it is implovd, invented by the Wit of Man?*

To this Head of the Fitness of the Parts of the Body to the Creatures nature and manner of living, belongs that Observation of Aristotle, *On ornithOn hosa men champsOnochea sarkophaga panta*. Such Birds as have crooked Beaks and Talons, are all carnivorous; and so of quadrupeds; *karcharodonta* <greek>carnivora omnia</greek>. All that have serrate Teeth, are carnivorous. This Observation holds true
concerning all European Birds, but I know not but that Parrots may be an Exception to it. Yet it is remarkable, that such Birds as are carnivorous have no Gizzard, or musculous, but a Membranous Stomach, that kind of Food needing no such grinding or comminution as Seeds do, but being torn into strings or small Flakes by the Beak, may be easily concoeted by a Membranous Stomach.

To the fitness of all the Parts and Members of Animals to their respective Uses, may also be referred another Observation of the same Aristotle, <greek>Panta ta zOa artiQs echei podas</greek>. All Animals have even Feet, not more on one side than another; which if they had, would either hinder their walking, or hang by not only useless, but also burthensome. For though a Creature might make a limping shift to hop, suppose with three Feet, yet nothing so conveniently or steddily to walk, or run, or indeed to stand. So that we see, Nature hath made choice of what is most fit, proper, and useful. They have also not only an even number of Feet, answering by Pairs one to another, which is as well decent as convenient; but those too of an equal length, I mean the several Pairs; whereas were those on one side longer than they on the other, it would have caused an inconvenient halting or limping in their going.

I shall mention but one more Observation of Aristotle, that is, <greek> PtEnon monon oQden </greek>, there is no Creature only volatile, or no flying Animal but hath Feet as well as Wings, a power of walking or creeping upon the Earth; because there is no Food, or at least not sufficient Food for them to be had always in the Air; or if in hot Countries we may suppose there is, the Air being never without store of Insects flying about in it, yet could such Birds take no rest, or if in hot Countries we may suppose there is, the Air being never without store of Insects flying about in it, yet could such Birds take no rest, or if they should alight upon the Ground, they could by no means raise themselves any more, as we see those Birds which have but short Feet, as the Swift and Martinet, with difficulty do. Besides, they would want means of Breeding, having no where to lay their Eggs, to sit, hatch, or brood their Young. As for the Story of the Manucodiata, or Bird of Paradise, which in the former Ages was generally received and accepted for true, even by the Learned, it is now discover'd to be a Fable

and rejected and exploded by all Men: those Birds being well known to have Legs and Feet as well as others, and those not short, small, nor feeble ones, but sufficiently great and strong, and arm’d with crooked Talons, as being the Members of Birds of Prey.

<1717>It is also very remarkable, That all flying Insects should be covered with shelly Scales, lile Armour, partly to secure them from external Violence, from Injuries by Blows and Pressures: partly to defend their tender Muscles from the Heat of the Sun-beams, which would be apt to parch and dry them up, being of small Bulk; partly also to restrain the Spirits, and to prevent their Evaporation.

I shall now add another Instance of the Wisdom of Nature, or rather the God of Nature, in adapting the Parts of the same Animal one to another, and that is the proportioning the length of the Neck to that of the Legs. For, seeing Terrestrial Animals, as well Birds as Quadrupeds, are endued with Legs, upon which they Stand, and wherewith they transfer themselves from Place to Place, to gather their Food and for other conveniences of Life, and so the Trunk of their Body must needs be elevated above the Superficies of the Earth, so that they could not conveniently either gather their Food or Drink, if they wanted a Neck,
therefore Nature hath not only furnished them therewith, but with such an one as is
commensurable to their Legs, except here the Elephant, which
hath indeed a short Neck; for the excessive

*157

weight of his Head and Teeth, which to a long Neck would have been unsupportable, but is
provided with a Trunk, wherewith, as with a
Hand, he takes up his Food and Drink, and brings it to his Mouth.

I say, the Necks of Birds and Quadrupeds are commensurate to their
Legs, so that they which have long Legs have long Necks, and they that have short Legs,
short ones, as is seen in the Crocodile, and all Lizards;
and those that have no Legs, as they do not want Necks, so neither have they any, as Fishes.
This equality between the Length of the Legs and Neck, is especially seen in Beasts that
feed constantly upon Grass, whose Necks and Legs are always very near equal; very near, I
say, because the Neck must necessarily have some Advantage, in that it cannot hang
perpendicularly down, but must incline a little: Moreover, because this Sort of Creatures
must needs hold their Heads down in an inclining Posture, for a considerable time together,
which would be very laborious and painful for the Muscles; therefore on each side the Ridge
of the Vertebræ of the Neck, Nature hath placed an <greek>aponeurosis</greek>, or
nervous Ligament of a great Thickness and Strength, apt to stretch and shrink again as Need
requires, and void of Sence, extending from the Head (to which, and the next Vertebræ of
the Neck, it is fastened at that end ) to the middle Vertebræ of the Back ( to which it knit at
the other) to assist them to support the Head in that Posture, which
<greek>aponeurosis</greek> is taken notice of by the Vulgar by the Name of Fixfax,
or

*158

Or Pack-wax, or Whit-leather. It is also very observable in Fowls that wade in the Water,
which having long Legs, have also Necks answerably long: Only in these too there is an
Exception, exceeding worthy to be noted; for some Water Fowl, which are Pampilids, or
whole-footed, have very long Necks, and yet but short Legs, as Swans and Geese, and some
Indian Birds; wherein we may observe the admirable Providence of Nature. For such Birds
as were to search and gather their Food, whether Herbs or Insects, in the bottom of Pools
and deep Waters, have long Necks for that purpose, though their Legs, as is most convenient
for Swimming, be but short.

Whereas there are no Land-Fowl to be seen with short Legs and long Necks, but all have
their Necks in Length commensurate to their Legs. This instance is the more considerable,
because the Atheists usual Flam will not here help them out. For (say they) there were many
Animals of disproportionate Parts, and of absurd and uncouth Shapes produced at first in
the Infancy of the World; but because they could not gather their Food, or perform other
Functions necessary to maintain Life, they soon perished, and were lost again. For these
Birds, we see, can gather their Food upon Land conveniently enough, notwithstanding the
length of their Necks. For example, Geese graze upon Commons, and can feed themselves
fat upon Land: Yet is there not one Land Bird, which hath its neck thus disproportionate to
its Legs; nor one

*159

Water one neither, but such as are destined by Nature in such manner as we have mentioned
to search and gather their Food. For Nature makes not a long Neck to no purpose.
Lastly, Another Argument of Providence and Counsel relating to Animals, is the various kinds of Voices the same Animal uses on divers occasions, and to different Purposes. Hen-Birds, for Example, have a peculiar sort of Voice when they would call the Male; which is so eminent in Quails, that it is taken Notice of by Men, who by counterfeiting this Voice with a Quailpipe, easily drew the Cocks into their Snares. The common Hen, all the while she is broody, sits, and leads her Chickens, uses a Voice which we call Clocking. Another she employs when she calls her Chickens to partake of any Food she hath found for them; upon hearing whereof they speedily run to her. Another when upon sight of a Bird of Prey, or apprehension of any danger, she would scare them, bidding them, as it were, to shift for themselves whereupon they speedily run away, and seek Shelter among Bushes, or in the thick Grass, or elsewhere dispersing them selves far and wide. These Actions do indeed necessarily infer Knowledge and Intention of, and Direction to the Ends and Uses to which they serve, not in the Birds themselves, but in a superiour Agent, who hath put an Instinct in them of using such a Voice upon such an occasion; and in the Young of doing that upon hearing of it, which by Providence was intencled. Other Voices she hath

*160 when angry, when she hath laid an Egg, when in Pain, or great Fear, all significant, which may more easily be accounted for, as being Effects of the several Passions of Anger, Grief, Fear, Joy: Which yet are all argumentative of Providence, intending their several Significations and Uses.

I might also Instance in Quadrupeds; some of which have as great a Diversity of Voices as Hens themselves: And all of them significant, for Example, That common domestick Animal the Cat, as is obvious to every one to observe and therefore I shall not spend Time to mention Particulars.</1717>

Object[ion?].

But against the Uses of several Bodies I have Instanced in, that refer to Man, it may be objected, That these Uses were not designed by Nature in the Formation of the Things; but that the Things were by the Wit of Man accommodated to those Uses.

To which I answer, with Dr.More, in the Appendix to his Antidote against Atheism, That the Several useful Dependencies of this Kind (viz of Stones, Timber, and Metals, for building of Houses or Ships, the Magnet, for Navigation, &c. Fire for melting of Metals, and forging of Instruments for the Purposes mentioned) we only find, not make them. For ••whether we think of it or no, it is, for Example, manifest, that Fuel is good to continue Fire, and Fire to melt Metals, and Metals to make Instruments to build Ships and Houses, and so on. wherefore it being true, that there is

*161 such a subordinate usefulness in the Things themselves that are made to our hand, it is but Reason in us to impute it to such a Cause, as was aware of the usefullness and serviceableness of its own Works. To which I shall add, that since we find Materials so fit to serve all the Necessities and Conveniencies, and to exercise and employ the Wit and Industry of an intelligent and active Being, and since there is such an one created that is endued with Skill and Ability to use them, and which by their help is enabled to rule over and subdue all inferior Creatures, but without them had been left necessitous, helpless, and obnoxious to Injuries above any other; and since the Omniscient Creator could not but know all the Uses, to which they might and would be employed by Man, to them that acknowledge
the Being of a Deity, it is little less than a Demonstration, that they were created intentionally I do not say only, for those Uses.

Methinks, by all this Provision for the Use and Service of Man, the Almighty interpretatively speaks to him in this manner: I have now placed thee in a spacious and well-furnished World, I have endued thee with an ability of Understanding what is beautiful and proportionable, and have made that which is so, agreeable and delightful to thee; I have provided thee with Materials whereon to exercise and employ thy Art and Strength: I have given thee an excellent Instrument, the Hand, accomodated to make use of them all; I have

*162

distinguished the Earth into Hills and Valleys and Plains, and Meadows, and Woods; all these Parts capable of Culture and Improvement by thy Industry; I have committed to thee for thy assistance in thy Labours of Ploughing, and Carrying, and Drawing, and Travel, the laborious Ox, the patient Ass, and the strong and serviceable Horse:

I have created a Multitude of Seeds for thee to make choice out of them, of what is most pleasant to thy Taste, and of most wholesome and plentiful Nourishment; I have also made great Variety of Trees, bearing Fruit both for Food and Physick, those too capable of being meliorated and improved by Transplantation, Stercoration, Insition, Pruning, Watering and other Arts and Devices. Till and Manure thy Fields, sow them with thy Seeds, extirpate noxious and unprofstable Herbs, guard them from the invasions and spoil of Beasts, clear and fence in thy Meadows and Pastures; dress and prune thy Vines, and so rank and dispose them as is most suitable to the Climate; Plant thee Orchards, with all Sorts of Fruit-Trees, in such order as may be most beautiful to the Eye, and most comprehensive of Plants; Gardens for culinary Herbs, and all Kinds of Salletting; for delectable Flowers, to gratifie the Eye with their agreeable Colours and Figures, and thy Scent with their fragrant Odors; for Odoriferous and Ever-green Shrubs and Suffrutices; for Exotick and Medicinal Plants of all sorts and dispose of them in that comely Order, as may be both pleasant to behold, and commodious for access.

*163

I have furnished thee with all Materials for Building, as Stone, and Timber, and Slate, and Lime, and Clay, and Earth, whereof to make Bricks and Tiles, deck and bespangle the Country with Houses and Villages convenient for thy Habitation, provided with Out-houses and Stables for the harbouring and Shelter of thy Cattle with Barns and Granaries for the reception, and custody, and storing up thy Corn and Fruits. I have made thee a sociable Creature, <greek>ZOon politikon</greek>, for the improvement of thy Understanding by Conference, and Communication of Observations and Experiments; for mutual help, and assistance, and defence; build thee large Towns and Cities with streight and well-paved Streets, and elegant Rows of Houses, adorned with magnificent Temples for my Honour and Worship, with beautiful Palaces for thy Princes and Grandees, with stately Halls for publick Meetings of the Citizens and their several Companies, and the Sessions of the Courts of Judicature, besides Publick Portico's and Aqueducts.

I have implanted in thy Nature a desire of seeing strange and foreign, and finding out unknown Countries, for the improvement and advance of thy Knowledge in Geography, by observing the Bays, and Creeks, and Havens, and Promontories, the Outlets of Rivers, the Situation of the Maritime Towns and Cities, the Longitude and Latitude, &c of those Places: In Politicks, by noting their Government, their Manners, Laws, and Customs, their Diet and Medicine, their Trades
and Manufactures, their Houses and Buildings, their Exercises and Sports, &c. In Physiology, or Natural History, by searching out their Natural Rarities, the Productions both of Land and Water, what Species of Animals, Plants, and Minerals, of Fruits and Drugs are to be found there, what Commodities for Bartering and Permutation, whereby thou may'st be enabled to make large Additions to Natural History, to advance those other Sciences, and to benefit and enrich thy Country by increase of its Trade and Merchandize: I have given thee Timber and Iron to build the Hulls of Ships, tall Trees for Masts, Flax and Hemp for Sails, Cables and Cordage for Rigging. I have armed thee with Courage and Hardness to attempt the Seas, and traverse the spacious Plains of that liquid Element; I have assisted thee with a Compass, to direct thy Course when thou shalt be out of all Ken of Land, and have nothing in view but Sky and Water. Go thither for the Purposes before-mentioned, and bring home what may be useful and beneficial to thy Country in general, or thy self in particular.

I perswade my self, that the bountiful and gracious Author of Man's Being and Faculties, and all things else, delights in the Beauty of his Creation, and is well Pleased with the Industry of Man, in adorning the Earth with beautiful Cities and Castles, with pleasant villages and Country-Houses, with regular Gardens and Orchards, and Plantations of all sorts

of Shrubs, and Herbs, and Fruits, for Meat, Medicine, or moderate Delight, with shady Woods and Groves, and Walks set with Rows of elegant Trees; with Pastures cloathed with Flocks, and Valleys covered over with Corn, and meadows burthened with Grass, and whatever else differenceth a civil and well cultivated Region, from a barren and desolate Wilderness.

If a Country thus planted and adorn'd, thus polished and civilized, thus improved to the height by all manner of Culture for the Support and Sustenance, and convenient Entertainment of innumerable multitudes of People, be not to be preferred before a barbarous and inhospitable Scythia, without Houses, without Plantations, without Corn-fields or Vineyards, where the roving Hords of the savage and truculent Inhabitants, transfer themselves from place to place in Waggons, as they can find Pasture and Forrage for their Cattle, and live upon Milk, and Flesh roasted in the Sun, at the Pomels of their Saddles; or a rude and unpolished America, peopled with slothful and naked Indians, instead of well-built Houses, living in pitiful Huts and Cabbins, made of Poles set end-ways; then surely the brute Beasts Condition, and manner of Living, to which, what we have mention'd doth nearly approach, is to be esteem'd better than Man's, and Wit and Reason was in vain bestowed on him.

Larly, I might draw an Argument of the admirable Art and Skill of the Creator and Composer of them, from the incredible Smalness of some of those natural and enlevined Machines, the Body of Animals.

Any Work of Art of extraordinary Fineness and Subtlety, be it but a small Engine or Movement, or a Curious carved or turned Work of Ivory or Metals, such as those Cups turned of Ivory by Oswaldus Nerlinger of Suevia, mention'd by Joannes Faber in his Expositions of Recchus his Mexican Animals, which all had the perfect form of Cups, and were gilt with a Golden Border about the Brim, of that wonderful smallness, that Faber himself put a thousand of them into an excavated Pepper corn; and when he was weary of
the Work, and yet had not filled the Vessel, his Friend, John Carlus Schad, that shewed them
him, put in four hundred more. Any such Work, I say, is beheld with admiration, and
purchased at a great Rate, and treasured up as a singular Rarity in the Museums and
Cabinets of the Curious, and as such is one of the first things shew’d to Travellers and
Strangers. But what are these for their fineness and parvity (for which alone, and their
Figure, they are considerable) to those Minute
Machines endued with life and motion, I mean, the Bodies of those Animalcula, not long
since discovered in Pepper–water, by Mr Leuenhoek of Delft in Holland, (whose
Observations were confirmed and improved by our learned and Worthy

Country-man Dr Robert Hook) who tells us, That some of his Friends (whose Testimonials
he desired) did affirm, That they had seen 10000, others 30000, others 45000 little living
Creatures, in a Quantity of Water no bigger than a Grain of Millet; and yet he made it his
Request to them, that they would only justify (that they might be within compass) half the
number that they believed each of them saw in the Water. From the greatest of these
Numbers he infers, that there will be 8280000 of these living Creatures seen in one drop of
Water; which number (saith he) I can with Truth affirm, I have discerned. This (proceeds he)
doeth exceed belief: But I do affirm, if a larger Grain of Sand were broken into
8000000, of equal Parts, one of these would not exceed the bigness of one of those
Creatures.

Dr. Hook tells us, That after he had discovered vast multitudes of those exceeding small
Creatures which Mr. Leuenhoek had described, upon
making use of other Lights and Glasses, he not only magnified those he had discovered to a
very great bigness, but discovered many other
sorts very much smaller than them he first saw, and some of them so exceeding small, that
Millions of Millions might be contain’d in one
drop of Water. If Pliny, considering such Insects as were known to him, and those were none
but what were visible to the naked Eye, was moved to cry out, That the Artifice of Nature
was no where more conspicuous than in these. And again, <latin>In his tam parvis atque
tam
nullis quae ratio, quanta vis, quam inextricabilis perfectio?</latin> And again,
<latin>Rerum natura nusquam magis quam in minimis tota est</latin>, Hist. Nat. l. 111. c. I.
What would he have said if he had seen Animals of so stupendous smallness, as I have
mention’d ? How would he have been rapt into an Extasie of Astonishment and Admiration
?

Again, if considering the Body of a Gnat, (which by his own Confession is none of the least
of Insects) he could make so many admiring Queries, Where hath Nature disposed so many
inseruit ? Ubi vero truculentam illam et portione maximam vocem ingeneravit ? Qua
subtilitate pennas adnexuit ? Praelongavit pedum crura ? Disposuit jejunam caveam uti
alvum ? Avidam sanguinis et potissimum humani sitim accedit ? Telum vero perfodiendo
tergori quo spiculavit ingenio ? Atque ut in capaci, cum cerni non possit exilias, ita
reciproca geminavit arte, ut fodiendo acuminatum pariter sorbendoque fistulosum
esset.</latin>  **122> Which Words should I translate, would lose of their Emphasis and
Elegancy; If, I say, he could make such Queries about the Members of a Gnat, what may we
make ? And what would he in all likelihood have made had he seen these incredibly small
living Creatures? How would he have admired the immense Subtilty (as he phrases it) of their Parts? For to use Mr. Hook's words in his *Microscopium* p. 103. If these

*169 Creatures be so exceedingly small, what must we think of their Muscles and other Parts? Certain it is, that the Mechanism by which Nature performs the Muscular Motion, is exceeding small and curious, and to the performance of every Muscular Motion, in greater Animals at least, there are not fewer distinct parts concerned than many Millions of Millions, and these visible through a Microscope.

Use. Let us then consider the Works of God, and observe the Operations of his Hands: Let us take notice of, and admire his infinite Wisdom and Goodness in the Formation of them: No Creature in this sublunary World is capable of so doing, beside Man, and yet we are deficient herein: We content ourselves with the Knowledge of the Tongues, on a little Skill in Philology, or History perhaps, and Antiquity, and neglect that which to me seems more material, I mean, Natural History, and the Works of the Creation: I do not dis commend, or derogate from those other Studies: I should betray mine own Ignorance and Weakness should I do so; I only wish they might not altogether jostle out, and exclude this. I wish that this might be brought in fashion among us; I wish Men would be equal and civil, as not to disparage, deride, and vilifie those Studies which themselves skill not of, or are not conversant in; no Knowledge can be more pleasant than this, none that doth so satisfie and feed the Soul; in comparison

*170 whereto that of Words and Phrases seems to me insipid and jejeune That Learning (saith a wise and observant Prelate) which consists only in the Form and Pedagogy of Arts or the critical Notions upon Words and Phrases, hath in it this intrinsical imperfection that it is only so far to be esteemed, as it conduceth to the Knowledge of Things, being in itself but a kind of Pedantry, apt to insect a Man with such odd Humours of Pride and Affectation, and Curiosity, as will render him unfit for any great Employment. Words being but the Images of Matter, to be wholly given up to the study of these, what is it but Pygmalion's Frenzy, to fall in Love with a Picture or Image? As for Oratory, which is the best skill about Words, that hath by some wise Men been esteem'd, but a voluntary Art like to Cookery, which spoils wholesome Meats, and helps unwholesome, by the variety of Sauces, serving more to the Pleasure of Taste, than the Health of the Body.

It may be (for ought I know, and as some Divines have thought) part of our Business and Employment in Eternity, to contemplate the Works of God, and give him the Glory of his Wisdom Power, and Goodness, manifested in the Creation of them. I am sure it is part of the Business of a Sabbath-day, and the Sabbath is a Type of that Eternal Rest; for the Sabbath seems to have been first instituted for a Commemoration of the Works of

*171 the Creation, from which God is said to have rested upon the Seventh-Day.

<1717>It is not likely that Eternal Life shall be a torpid and unactive state, or that it shall consist only in an uninterrupted and endless Act of Love; the other Faculties shall employed as well as the Will, in Actions suitable to, and perfective of their Natures; especially the Understanding, the Supreme Faculty of the Soul, which chiefly differenceth us from brute Beasts, and makes us capable of Virtue and Vice, of Rewards and Punishments, shall be busied and employed in contemplating the Works of God, and observing the Divine Art and Wisdom manifested in the Structure and Composition of them; and reflecting upon their
Great Architect the Praise and Glory due to him. Then shall we clearly see to our great satisfaction and admiration, the Ends and Uses of these Things which here were either too subtle for us penetrate and discover, or too remote and inaccessible for us to come to any distinct view of, viz the Planets, and fix'd Stars; those illustrious Bodies, whose Contents and Inhabitants, whose Stores and Furniture we have here so longing a desire to know, as also their mutual subserviency to each other. Now the Mind of Man being not capable at once to advert to more than one thing, a particular View and Examination of such an innumerable number of vast Bodies, and the great

multitude of Species, both of animate and inanimate Beings, which each of them contains, will afford Matter enough to exercise and employ our Minds, I do not say, to all eternity, but to many Ages, should we do nothing else. </1717>

Let it not suffice us to be Book-learned, to read what others have written, and to take upon Trust more Falsehood than Truth: But let us ourselves examine things as we have opportunity, and converse with Nature as well as Books. Let us endeavour to promote and encrease this Knowledge, and make new Discoveries, not so much distrusting our own Parts, or despairing of our own Abilities, as to think that our Industry can add no thing to the Invention of our Ancestors, or correct any of their Mistakes. Let us not think that the bounds of Science are fixed like Hercules's Pillars, and inscribed with a <latin>Ne plus ultra</latin>. Let us not think we have done, when we have learnt what they have delivered to us.

The Treasurers of Nature are inexhaustible. Here Is Employment enough, for the vastest Parts, the most indefatigable Industries, the happiest Opportunities, the most prolix and undisturb'd Vacancies.

<1717><latin>Multa venientis aevi populus ignota nobis sciet: Multa seculis tunc futuris, cum memoria nostri exoleverit reservantur. Pusilla res mundus est, nisi in eo quod quaerat omnis mundus habeat, Seneca Nat. Quaest. lib. 7. cap. 31. The People of the next Age shall know many Things unknown to us: Many

*173

are reserved for Ages then to come, when we shall be quite forgotten, no Memory of us remaining. The World would be a pitiful small Thing, indeed, if it did not contain enough for the Erlquiries of the whole World. Yet, and again, Epistle 64. <latin>Multum adhuc restat Operis, multumque restabit, nec uilli nato post mille saecula praeceditur occasio aliquid adhuc adiciendi.</latin> Much Work still remains, and much will remain, neither to him that shall be born after a thousand Ages, will matter be wanting for new additions to what hath already been invented.</1717>

Much might be done, would we but endeavour, and nothing is insuperable to Pains and Patience. I know that a new Study at first seems very vast, intricate, and difficult; but after a little resolution and progress, after a Man becomes a little acquainted, as I may so say, with it, his Understanding is wonderfully cleared up and enlarged, the Difficulties vanish and the thing grows easie and familiar. And for our encouragement in this Study, observe what the Psalmist saith, Psalm 111:2 "The works of the Lord are great, sought out of all them that have pleasure therein." Which though it be principally spoken of the Works of Providence, yet may as well be verified of the Works of Creation. I am sorry to see so little count made of real Experimental Philosophy in this University; and that those ingenious Sciences of the Mathematicks are so much neglected by us: And therefore do earnestly
exhort those that are young, especially Gentlemen, to set upon these Studies, and take some pains in them. They may possibly invent something of eminent Use and Advantage to the World; and one such Discovery would abundantly compensate the Expence and Travel of one Man’s whole Life. However, it is enough to maintain and continue what is already invented: Neither do I see what more ingenious and manly Employment they can pursue, tending more to the Satisfaction of their own Minds, and the Illustration of the Glory of God. For he is wonderful in all his Works.

But I would not have any Man cross his natural Genius or Inclinations, or undertake such Methods of Study, as his Parts are not fitted to, or not serve those Ends to which his Friends upon mature Deliberation have designed him; but those who do abound with Leisure, or who have a natural Propension and Genius inclining them thereto, or those who by Reason of the Strength and Greatness of their Parts, are able to compass and comprehend the whole Latitude of Learning.

Neither yet need those who .are designed to Divinity itself, fear to look into these Studies, or think they will engross their whole Time, and that no considerable Progress can be made therein, unless Men lay aside and neglect their ordinary Callings, and necessary Employments. No such matter. Our Life is long enough,

and we might find Time enough, did we husband it well: <latin>Vitam non accepimus brevem sed fecimus, nec inopes eius, sed prodigi sumus</latin>, as Seneca saith, <1717>"We have not received a short Life, but have made it so; neither do we want time but are prodigal of it."</1717> And did but young Men fill up that time with these Studies, which lies upon their Hands, which they are incumbered with, and troubled how to pass away, much might be done even so. I do not see but the Study of true Physiology, may be justly accounted a proper or <greek>Propaideia</greek> Preparative to Divinity.

But to leave that, it is a generally received Opinion, that all this visible World was created for Man; that Man is the end of the Creation, as if there were no other end of any Creature, but some way or other to be serviceable to Man. This Opinion is as old as Tully; for, saith he, in his Second Book De Nat. Deorum. <LATIN>Principio ipse Mundus Deorum hominumque causa factus est: quaeque in eo sunt omnia ea parata ad fructum hominum et inventa sunt.</LATIN> But though this be vulgarly receiv’d, yet wise Men now-a-days think otherwise. Dr. More affirms, "That Creatures are made to enjoy themselves as well as to serve us; and that it's a gross piece of Ignorance and Rusticity to think otherwise. And in another Place: "This comes only out of Pride and Ignorance, or a haughty Presumption, because we are encouraged to believe, that, in some Sense, all Things are made for Man; therefore to think that

they are not at all made for themselves. But he that pronounceth this, is ignorant of the Nature of Man and the Knowledge of Things. For if a good Man be merciful to his Beast, then surely a good God is bountiful and benign, and takes Pleasure that all his Creatures enjoy themselves, that have Life and Sense, and are capable of Enjoyment.

<1717>Those Philosophers indeed, who hold Man to be the only Creature in this sublunary World, endued with Sense and Perception, and that all other Animals are meer Machines or Puppets, have some Reason to think, that all things here below were made for Man. But this
Opinion seems to me too mean, and unworthy the Majesty, Wisdom and Power of God; nor can it well consist with his Veracity, instead of a Multitude of Noble Creatures, endued with Life and Sense, and spontaneous Motion, as all Mankind 'till of late Years believed, and none ever doubted of (so that it seems we are naturally made to think so) to have stocked the Earth with divers Sets of Automata, without all Sense and Perception, being wholly acted from without, by the Impulse of external Objects.

But be this so, there are infinite other Creatures without this Earth, which no considerate Man can think, were made only for Man, and have no other use. For my part I cannot believe, that all the Things in the World were so made for Man, that they have no other use. </1717>

*177

<1691>For it is</1691><1717> For it seems to me</1717> highly absurd and unreasonable, to think that Bodies of such vast Magnitude as the fix'd Stars were only made to twinkle to us; nay, a multitude of them there are, that do not so much as twinkle, being either by Reason of their Distance or of their Smalness, altogether Invisible to the naked Eye, and only discoverable by a Telescope; and it is likely, perfecter Telescopes than we yet have, may bring to light many more; and who knows, how many lie out of the Ken of the best Telescope that can possibly be made?

And I believe there are many Species in Nature, even in this sublunary World, which were never yet taken Notice of by Man, and consequently of no Use to him, which yet we are not to think were created in vain; but may be found out by, and of Use to those who shall live after us in future Ages. But though in this Sense it be not true, that all Things were made for Man; yet thus far it is, that all the Creatures in the World may be some way or other Useful to us, at least to exercise our Wits and Understandings, in considering and contemplating of them, and So afford us Subject of admiring and glorifying their and our Maker.

Seeing then, we do believe, and assert, that all Things were in some Sense made for us, we are thereby oblig'd to make Use of them for those Purposes for which they serve us, else we frustrate this End of their Creation. Now some of them serve only to exercise our Minds: Many others there

*178

be, which might probably serve us to good Purpose, whose Uses are not discovered, nor are they ever like to be, without Pains and Industry. True it is, many of the greatest Inventions <**130> have been accidentally stumbled upon, but not by Men, Supine and Careless, but busie and inquisitive. Some Reproach methinks it is to Learned Men, that there should be so many Animals in the World, whose outward shape is not yet taken Notice of; or describ'd, much less their Way of Generation, Food, Manners, Uses, observed.

<1717>The Scripture, Psalm 148 calls upon "The Sun, Moon, and Stars; Fire and Hail, Snow and Vapour; stormy Winds and Tempests, Mountains and all Hills; fruitful Trees, and all Cedars; Beasts and all Cattle; creeping Things and flying Fowl, etc. to praise the Lord. How can that be? Can senseless and inanimate Things praise God? Such as are the Sun, and Moon, and Stars. And although Beasts be advanced higher to some Degree of Sense and Perception; yet being void of Reason and Understanding, they know nothing of the Causes of Things, or of the Author and Maker of themselves, and other Creatures. All that they are capable of doing, in reference to the praising of God, is (as I said before) by affording Matter or Subject of praising him, to rational and intelligent Beings. So the Psalmist, Psalm
And therefore the Psalmist, when he calls upon 

*179
Sun, and Moon, and Stars, to praise God, doth in effect call upon Men and Angels, and other rational Beings, to consider those great Effects of the Divine Power and Wisdom, their vast Dimensions, their regular Motions and Periods, their admirable Disposition and Order, their eminent Ends and Uses in illuminating and enlivening the Planets, and other Bodies about them, and their Inhabitants, by their comfortable and cherishing Light, Heat, and Influences, and to give God the Glory of his Power, in making such great and illustrious Bodies, and of his Wisdom and Goodness in so placing and disposing of them, so moving them regularly and constantly, without clashing or interfering one with another, and enduing them with such excellent Virtues and Properties as to render them so serviceable and beneficial to Man, and all other creatures about them.

The like may be said of Fire, Hail, Snow, and other Elements and Meteors, of Trees, and other Vegetables, of Beasts, Birds, Insects, and all Animals, when they are commanded to praise God, which they cannot do by themselves; Man is commanded to consider them particularly, to Observe and take Notice of their curious Structure, Ends, and Uses, and give God the Praise of his Wisdom and other Attributes therein manifested.

*180
And therefore those who have Leisure, Opportunity, and Abilities, to contemplate and consider any of these Creatures, if they do it not, do as it were rob God of some part of his Glory, in neglecting or slighting so eminent a Subject of it, and wherein they might have discovered so much Art, Wisdom, and Contrivance.

And it is particularly remarkable, that the Divine Author of this Psalm, amongst other Creatures, calls upon Insects also to praise God; which is as much as to say, ye Sons of Men, neglect none of his Works, those which seem most vile and contemptible; there is Praise belongs to him for them. Think not that any Thing he hath vouchsafed to create, is unworthy thy Cognizance, to be slighted by thee. It is Pride and Arrogance, or Ignorance and Folly in thee so to think. There is a greater depth of Art and Skill in the Structure of the meanest Insect, than thou art able for to fathom or comprehend.

<1691>If Man ought to reflect upon his Creator the Glory of all his Works, then ought he to take notice of them all, and not to think any thing unworthy of his Cognizance. And truly the Wisdom, Art...

The Wisdom Art, and Power of Almighty God, shines forth as visibly in the Structure of the Body of the minutest Insect, as in that of a Horse or Elephant: Therefore God is said to be, Maximus in minimis. We Men, esteem it a more difficult Matter, and of greater Art and Curiosity to frame a small Watch, than a large Clock: And no Man blames him who

*181
spent his whole time in the Consideration of the Nature and Works of a Bee, or thinks his Subject was too narrow. Let us not then esteem any thing contemptible or inconsiderable, or below our notice taking; for this is to derogate from the Wisdom and Art of the Creator, and to confess ourselves unworthy of those Endowments of Knowledge and Understanding which he hath bestowed on us. Do we praise Daedalus, and Architas, and Hero, and Callicrates, and Albertus Magnus, and many others which I might mention, for their Cunning in inventing, and Dexterity in framing and composing a few dead Engines or
Movements, and shall we not admire and magnifie the Great <greek>DEmiargos Kosma</greek> Former of the World, who hath made so many, yea, I may say, innumerable, rare Pieces, and those too not dead ones, such as cease presently to move so soon as the Spring is down, but all living, and themselves performing their own Motions, and those so intricate and various, and requiring such a Multitude of Parts and subordinate Machines, that is is incomprehensible, what Art, and Skill, and Industry, must be employed in the framing of one of them?

<1717>I have already noted out of Dr. Hook, that to the performance of every Muscular Motion, at least in greater Animals, there are not fewer distinct Parts concerned, than many Millions of Millions.

*182
Further, from the Consideration of our own Smallness and Inconsiderableness, in respect of the Greatness and Splendor of those glorious heavenly Bodies, the Sun, Moon, and Stars, to which our Bodies bear no proportion at all, either in Magnitude or Lustre; let us with the holy Psalmist raise up our Hearts, to magnifie the Goodness of God towards us in taking such Notice of us, and making such Provision for us, and advancing us so highly above all his Works, Psalm 8.3. When I consider the Heavens, the Work of thy Fingers, the Moon and the Stars which thou hast ordained. What is Man that thou art mindful of him, and the Son of Man that thou visitest him? For thou hast made him a little lower than the Angels, and hast crowned him with Glory and Honour, etc.</1717>

But it may be objected, that God Almighty was not so selfish and desirous of Glory, as to make the World and all the Creatures therein, only for his own honour, and to be praised by Man. To assert this, were, in Des Cartes's opinion, an absurd and childish Thing, and a resembling of God to a proud Man. It is more worthy the Deity, to attribute the Creation of the World, to the exundation and overflowing of his transcendent and infinite Goodness, which is of its own Nature, and in the very Notion of it, most free, diffusive, and communicative.

*183
To this I shall answer in two Words; First, The Testimony of Scripture makes God in all his Actions to intend and design his own Glory mainly, Prov. 16. 4. God made all things for himself. How, for himself? He hath no Need of them: he hath no Use of them. No, he made them for the Manifestation of his Power, Wisdom, and Goodness, and that he might receive from the Creatures that were able to take notice thereof, his Tribute of Praise, Psalm 50. 14. <bible>Offer unto God thanksgiving. </bible> And in the next verse, <bible>I will deliver thee, and thou shalt glorifie me. </bible> And again in the last Verse, <bible>Whoso offereth Praise, glorifieth me.</bible> So Praise is called a Sacrifice, and the Calves of the Lips, Hosea 14. 2. Esay 42. 8. I am the Lord, that is my Name, and my Glory will I not give to another. Efay 48. 11. And I will not give my Glory to another. The Scripture calls upon the heavens and Earth, and Sun and Moon, and Stars, and all other Creatures, to praise the Lord; that is, by the Mouth of Man, (as I Shewed before) who is hereby required to take notice of all these Creatures, and to admire and praise the Power, Wisdom and Goodness of God, manifested in the Creation and Designations of them.

Secondly, It is most reasonable that God Almighty should intend his own <**133> Glory: For he being infinite in all Excellencies and Perfections, and independent Upon any other Being;

*184
nothing can be said or thought of him too great, and which he may not justly challenge as is
due; nay, he cannot think too highly of himself, his other Attributes being adequate to his
Understanding: so that, though his Understanding be infinite, yet he understands no more
than his Power can effect, because that is infinite also. And therefore it is fit and reasonable,
that he should own and accept the Creatures Acknowledgments and Celebrations of those
Virtues and Perfections, which he hath not received of any other, but possesseth eternally
and originally of himself.

And indeed, (with Reverence be it spoken) what else can we imagine the ever Blessed Deity
to delight and take Complacency in for ever; but his own infinite Excellencies and
Perfections, and the Manifestations and Effects of them, the Works of the Creation, and the
Sacrifices of Praise and Thanks offered up by such of his Creatures as are capable of
considering those Works, and discerning the Traces and Footsteps of his Power and Wisdom
appearing in the Formation of them; and moreover, whose bounden Duty it is so to do;

The Reason why Man ought not to admire himself, or seek his own Glory, is because he is a
dependent Creature, and hath nothing but what he hath received, and not only dependent,
but imperfect; yea, weak and impotent: And yet I do not take Humility in Man to consist in
disowning or denying any Gift or Ability that is in him but in a just Valuation of such Gifts

and Endowments, yet rather thinking too meanly than too highly of them; because Humane
Nature is so apt to run into the other Extreme, to flatter itself, and to accept those
Praises that are not due to it; Pride being an Elation of Spirit upon false Grounds, or a desire
and acceptance of undue honour. Otherwise I do not see why a Man may not admit, and
accept the testimonies of others, concerning any Perfection, Accomplishment, or Skill, that
he is really possessed of, yet can he not think himself to deserve any Praise or Honour for
it, because both the Power and the Habit are the Gift of God: And considering that one
Virtue is counter-balanced by many Vices, and one Skill or Perfection, with much Ignorance
and Infirmitiy.

The End of the First Part,

The Second Part of the Wisdom of God
Manifested in the Works of the Creation:

Particularly in the
I. Whole Body of the Earth
II. Bodies of man.
And other Animals.

Printed for W.Innys, at the Prince's Arms in St. Paul's Church-yard, 1717.

The Wisdom of God in the Works of the Creation

Part II

I Proceed now to select some particular Pieces of the Creation, and to consider them more
distinctly. They shall be only <**135> Two:
I. Whole Body of the Earth
II. The Body of Man.

First, The Body of the Earth, and therein I shall take Notice of, 1. Its Figure. 2. Its Motion. 3. The Constitution of its Parts.

By Earth I here understand not the Dry Land, or the Earth contradistinguished to Water, or the Earth considered as an Element: But the whole Terraqueous Globe, composed of Earth and Water.

I. For the Figure, I could easily demonstrate it to be Spherical. That the Water, which by Reason of its fluidity should, one would think, compose itself to a Level, yet doth not so, but hath a Gibbose Superficies, may to the Eye be demonstrated upon the Sea. For when two Ships sailing contrary ways lose the sight one of another: first the Keel and Hull disappear; afterwards the Sails, and if when upon Deck you have perfectly lost sight of all, you get up to the Top of the Main-mast, you may descry it again. Now what should take away the sight of these Ships from each other but the gibbosity of the interjacent Water? The roundness of the Earth from North to South is demonstrated from the appearance of Northern Stars above the Horizon, and loss of the Southern to them that travel Northward and on the contrary, the loss of the Northern and appearance of the Southern to them that travel Southward. For were the Earth a Plain we should see exactly the same Stars wherever we were placed on that Plain. The roundness from East to West is demonstrated from Eclipses of either of the great Luminaries. For why the same Eclipse, suppose of the Sun, which is seen to them that live more Easterly, when the Sun is elevated 6 Degrees above the Horizon, should be seen to them that live but one degree more Westerly, when the Sun is but five degrees above the Horizon, and so lower and lower proportionably to them that live more and more Westerly, 'till at last it appear not at all, no Account can be given, but the globosity of the Earth. For were the Earth a perfect Plain, the Sun would appear Eclipsed to all that live upon that Plain, if not exactly in the same Elevation, yet pretty near it; but to be sure it would never appear to one, the Sun being elevated high above the Horizon; and not at all to others. It being clear then that the Figure of the Earth is Spherical, let us consider the Conveniencies of this Figure.

I. No Figure is so capacious as this, and consequently whose Parts are so well compacted and united, and lie so near one to another for mutual Strength. Now the Earth, which is the Basis of all Animals, and as some think of the whole Creation, ought to be firm, and stable, and solid, and as much as is possible secured from all Ruins and Concussions.

2. This Figure is most consonant and agreeable to the natural Nutus, or Tendency of all heavy Bodies. Now the Earth being such a one, and all its Parts having an equal propension, or connivency to the Center, they must needs be in greatest Rest, and most Immoveable when they are all equidistant from it. Whereas were it an Angular Body, all the Angles would be vast and steep Mountains, bearing a considerable Proportion to the whole bulk, and therefore those Parts being extremely more remote from the Center, than those about the Middle of the Plains, would consequently press very strongly thitherward; and unless the
earth were made of Adamant or Marble, in Time the other parts would give way, 'till all were levelled.

3. Were the Earth an Angular Body, and not round, all the whole Earth would be nothing else but vast Mountains, and so incommodious for Animals to live upon; for the middle Point of every Side would be nearer the Center than any other; and consequently from that Point which way soever one travelled would be up Hill, the Tendency of all heavy Bodies being perpendicularly to the Center. Besides, how much this would obstruct Commerce is easily seen: For not only the declivity of all Places would render them very difficult to be travelled over, but likewise the Middle of every Side being lower and nearer the Center, if there were any Rain, or any Rivers, must needs be filled with a Lake of Water, there being no Way to discharge it, and possibly the Water would rise so high, as to overflow the whole Land. But, surely, there would be much more danger of the Inundation of whole Countries than now there is, all the Waters falling upon the Earth, by Reason of its declivity every Way, easily descending, down to the common Receptacle of the Sea. And these Lakes of Water being far distant one from another, there could be no Commerce between far remote Countries, but by Land.

4. A Spherical Figure is most commodious for dinetial Motion or Revolution upon its Axis; for in that, neither can the Medium at all resist the motion of the Body, because it stands not in its way, no part coming into any Space but what the precedent left, neither doth one part of the Superficies move faster than another: Whereas were it Angular, the parts about the Angles would find strong resistance from the Air, and those parts also about the Angles would move much faster than those about the middle of the Plains, being remoter from the Center than they. It remains therefore that this Figure is the most commodious for Motion.

Here I cannot but take notice of the folly and stupidity of the Epicureans, who fansied the Earth to be flat and contiguous to the Heavens on all sides, and that it descended a great way with long Roots; and that the Sun was new made every Morning, and not much bigger than it seems to the Eye, and of a flat Figure, and many other such gross Absurdities as Children among us would be ashamed of.

Secondly, I come now to speak of the Motion of the Earth. That the Earth (speaking according to Philosophical Accurateness) doth move both upon its own Poles, and in the Ecliptick, is now the received Opinion of the most learned and skilful Mathematicians. To prove the diurnal Motion of it upon its Poles, I need produce no other Argument than, First, The vast disproportion in respect of Magnitude that is between the Earth and the Heavens, and the great unlikelihood, that such an infinite number of vast Bodies should move about so inconsiderable a spot as the Earth, which in comparison with them by the concurrent Suffrages of Mathematicians of both perswasions, is a mere point, that is, next to nothing.

Secondly, The immense and incredible Celerity of the Motion of the Heavenly Bodies in the Ancient Hypothesis.
Thirdly, Of its Annual Motion in the Ecliptick, the Stations and Retrogradations of the superior Planets are a convincing Argument, there being a clear and facile Account thereof to be given from the mere Motion of the Earth in the Ecliptick; whereas in the Old Hypothesis no account can be given, but by the unreasonable Fiction of Epicycles and contrary Motions; add hereto the great unlikelihood of such an enormous Epicycle as Venus must describe about the Sun, not under the Sun, as the old Astronomers fansied. About the Sun, I say, as appears by its being hid or eclipsed by it, and by its several Phases, like the Moon. So that whosoever doth clearly understand both Hypotheses, cannot, I persuade myself, adhere to the Old and reject

*195
the New, without doing some violence to his Faculties.

Against this Opinion lie two Objections, First, That it is contrary to Sense, and the common Opinion and Belief of Mankind. Secondly, that it seemeth contrary to some Expressions in Scripture. To the first I answer that our Senses are sometimes mistaken, and what appears to them is not <**141> always in reality so as it appears. For Example: The Sun or Moon appear no bigger, at most, than a Cart-wheel, and of a flat Figure. The Earth seems to be plain: The Heavens to cover it like a Canopy, and to be contiguous to it round about: A Fire-brand nimbly moved round, appears like a Circle of Fire; and to give a parallel Instance, a Boat lying still at Anchor in a River, to him that Sails and Rows by it, seems to move apace; and when the Clouds pass nimbly under the Moon, the Moon itself seems to move the contrary way; And there have been whole Books written in Confutation of vulgar Errors.

Secondly, As to the Scripture, when hpeaking of these things, it accommodates itself to the common and received Opinions, and employs the usual Phrases and Forms of Speech (as all Wise Men also do, though in strictness they be of a different or contrary Opinion) without intention of delivering any thing Doctrinally concerning these Points, or confuting the contrary: And yet by those that maintain the Opinion of the Earth's motion there might a convenient Interpretation be given

*196
of such Places as seem to contradict it. Howbeit, because some pious Persons may be offended at such an Opinion, as favouring of Novelty, thinking it inconsistent <**142> with Divine Revelation, I shall not positively assert it, only propose it as an Hypothesis not altogether improbable. Supposing then, that the Earth doth move, both upon its own Poles, and in the Ecliptick about the Sun, I shall shew how admirably its Station and Motion are contrived for the conveniency of Man and other Animals: Which I cannot do more fully and clearly than Dr. More hath already done in his Antidote against Atheism, whose Words therefore I shall borrow.

First, Speaking of the Parallelism of the Axis of the Earth, he saith, I demand whether it be better to have the Axis of the Earth steady and perpetually parallel to itself, or to have it carelessly tumble this way and that way as it happens, or at least very variously and intricately ? And you cannot but Answer me, it is better to have it steady and parallel. For in this lies the necessary Foundation of the Art of Navigation and Dialling. For that steady Stream of Particles, which is supposed to keep the Axis of the Earth parallel to itself, affords the Mariner both his Cynosura and his Compass. The Load-stone and the Load-star depend both upon this. The Load-stone, as I could demonstrate, were it not too great a digression; and the Load-star, because that which keeps the Axis parallel to itself, makes each of the Poles
constantly respect such a Point in the Heavens as for Example, the North-Pole to point almost directly to that which we call the Pole-Star. And besides, Dialling could not be at all without this steadiness of the Axis. But both thes Arts are pleasant, and one especially of mighty Importance to Mankind. For thus there is an orderly measuring of our time for Affairs at home, and an opportunity of Traffick abroad with the most remote Nations of the World and so there is a mutual Supply of the several Commodities of all Countries. Besides the enlarging our Understandings by so ample Experience we get both of Men and Things. Wherefore if we were rationally to consult, whether the Axis of the Earth were better be held steady, and parallel to itself; or left at random, we would conclude it ought to be steady, and so we find it de Facto, though the Earth move floating in the liquid Heavens. So that appealing to our own Faculties we are to affirm, that the constant Direction of the Axis of the Earth was Establishe by a Principle of Wisdom and Counsel.

Again, there being several Postures of the steady Direction of the Axis of the Earth, viz. either perpendicular to a Plain, going through the Center of the Sun, or co-incident or inclining, I demand which of all these Reason and Knowledge would make choice of. Not of a perpendicular Posture; for so both the pleasant Variety, and great Convenience of Summer and Winter; Spring and Autumn, would be lost, and for want of Accession of the Sun, these Parts of the Earth, which now bring forth Fruits, and are Habitable, would be in an incapacity of ever bringing forth any sith then, the heat could never be greater than now it is at our 10th of March, or the 11th of September, and therefore not sufficient to bring their Fruits and Grain to Maturity, and consequently could entertain no Inhabitants, and those Parts that the full heat of the Sun could reach, he plying them always alike without any annual Recession or Intermission, would at last grow tired or exhausted, or be wholly dried up, and want moisture, the Sun dissipating and casting off the Clouds Northwards and Southwards. Besides, we observe that an orderly Vicissitude of Things, doth much more gratifie the Contemplative Property in Man. And now in the second Place neither would Reason make choice of a co-incident position. For if the Axis thus lay in a Plain that goeth through the Center of the Sun, the Ecliptick would like a Colure or one of the Meridians, pass through the Poles of the Earth, which would put the Inhabitants of the World into a pitiful condition. For they that escape best in the Temperate Zone, would be accloyed with long Nights very tedious, no less than forty Days, and those that now never have their Night above twenty-four Hours, as Friesland Island, the further Parts of Russia and Norway, would be deprived of the Sun, above a Hundred and Thirty Days together. Ourselves in England, and the rest of the same Clime, would be closed up in Darkness no less than a Hundred or Eighty Days; and so proportionably of the Rest, both in and out of the Temperate Zones. And as for Summer and Winter, though those Vicissitudes would be, yet it could not but Cause raging Diseases, to have the Sun stay so long, describing his little Circles so near the Poles, and lying so hot on the inhabitants, that had been in so long extremity of Darkness and Cold before.

It remains therefore, that the posture of the Axis of the Earth be inclining not perpendicular, not co-incident to the fore-mention'd Plain. And verily, it is not only inclining, but in so fit a Proportion, that there can be no fitter imagined to make it to the utmost Capacity, as well pleasant as habitable. For though the Course of the Sun be curbed between the Tropicks, yet are not those Parts directly subject to his perpendicular Beams, either Unhabitable, or
extremely Hot, as the Ancients fansied: By the Testimony of Travellers, and particularly Sir Walter Raleigh, the parts under and near the Line, being as fruitful and pleasant, and fit to make a Paradise of, as any in the World. And that they are as suitable to the Nature of Man, and as convenient to live in, appear from the Longevity of the Natives; as for

*200
Instance, the Ethiopes, called by the Ancients <greek>Machrobioi</greek>; but especially in the Brazilians in America, the ordinary Term of whose Life is a Hundred Years, as is set down by Piso, a Learned Physician of Holland, who travelled thither on purpose to augment Natural Knowledge, but especially what related to Physick. And rafronable it is, that this should be so, for neither doth the Sun lie long upon them, their day being but twelve Hours, and their Night as long, to cool and refresh them, and besides they have frequent Showers, and constant Breezes, or fresh Gales of Wind from the East.

<1717>It was the Opinion of Asclepiades, as Plutarch reports, that generally the Inhabitants of Cold Countries are longer live'd than those of Hot because the cold keeps in the natural heat, as it were locking up the Pores to prevent its Evaporation; whereas in hot Regions the heat is easily dissipated, the Pores being large and open to give it way. Which opinion, because I find some Learned Men still to adhere to, I shall produce some further Instances out of Monsieur Rochefort’s History of the Antilles Islands, to confirm the contrary, and to shew how often and easily we may be deceiv'd, if we trust to our own Ratiocinations, how plausible soever, and consult not Experience.

The ordinary Life (saith he) of our Caribbeans is an hundred and fifty years long, and sometimes more. There were some among them not long since living, who remembred to have

*201
seen the first Spaniards, that aborded America, who, we may thence conclude, lived to be at least 160 years old.

The Hollanders who traffick in the Molucca Islands, assure us, that the ordinary term of Life of the Natives there is one hundred and thirty years.

Vincent le Blanc tells us, that in Sumatra, Java, and the neighbouring Islands, the life of the Inhabitants is extended to 140 Years, and that in the Realm of Cassuby it reaches 150. Francis Pirara promotes the life of the Brazilians beyond the Term we have set it, v.g. to 160 years or more, and says that in Florida and Jucatan there are Men found, who pass that age. And it is said, that the French in Laudoniers Voyage into Florida, Anno. 1564. saw a certain old Man, who affirmed himself to be three hundred years old, and the Father of five Generations; “And well he might be of double that number”.

Lastly, Mapheous reports, that a certain Bengalese vaunted himself to be 335 years old. So far Monsieur Rochefort. Indeed these two last Instances, being perchance singular and extraordinary, do not prove the point; for even among us, where the ordinary term of Life is about threescore and ten, or fourscore, there occur some rare instances of Persons, who have lived 130, 140, 150 Years and more. But the other Testimonies being general, prove it beyond contradiction; neither yet is the thing

*202
in itself improbable; for there being not so great inequality of Weather in those hot Countries, as there is in cold, the Body is kept in a more equal Temper, and not having such frequent Shocks, as are occasion'd by such Air, and often changes, and that from one extreme to another, holds out much longer. So we see infirm and crazy Persons, when they come to be so weak as to be fixed to their Beds, hold out many Years, some I have heard of, that have laid bed-rid 20 years: because in the Bed they are always kept in an almost equal Temper of Heat, who, had they been exposed to the excesses of Heat and Cold, would not probably have survived one.

Seeing then, this best posture which our Reason could make choice of; we see really established in Nature, we cannot but acknowledge it to be the issue of Wisdom, Counsel, and Providence. Moreover, a further Argument to evince this is, That though it cannot but be acknowledged, that if the Axis of the Earth were perpendicular to the Plane of the Ecliptick, her motion would be more easie and natural, yet notwithstanding for the Conveniences fore-mentioned, we see it is made in an inclining posture.

Another very considerable, and heretofore unobserv'd Convenience of this inclination of the Earth's Axis, Mr. Kiel affords us in his Examination of Dr. Burnet's "Theory of the Earth", p. 69.

There is (saith he) one more [besides what he had mentioned before] considerable advantage, which we reap by the present position of the Earth, which I will here insert, because I do not know that it is taken notice of by any. And it is, that by the present inclination of the Earth's Axis to the Plane of the Ecliptick, we who live beyond 45 degrees of Latitude, and stand most in need of it, have more of the Sun's heat throughout the year, than if he had shined always in the Equator, that is, if we take the sum of the Sun's actions upon us both in Summer and Winter, they are greater than its Heat would be if he moved always in the Equator or, which is the same thing, the aggregate of the Sun's heat upon us while he describes any two opposite Parallels, is greater than it would be if in those two Days he described the Equator. Whereas in the Torrid Zone, and even in the Temperate almost as far as 45 degrees of Latitude, the sum of the Sun's heat in Summer and Winter is less than it would be, were the Axis of the Earth perpendicular to the Plane of the Ecliptick. For the Demonstration of which, I refer the Reader to the Book itself.

I think (proceeds he) this Consideration can not but lead us into a transcendent admiration of the Divine Wisdom, which hath placed the Earth in such a posture as brings with it several Conveniencies beyond what we can easily discover without Study and Application: And I make no question, but if the rest of the Works of Nature were well observed, we should find several advantages which accrue to us by their present Constitution, which are far beyond the uses of them that are yet discovered; by which it will plainly appear, that God hath chosen better for us than we could have done for ourselves.

If any Man should object and say, it would be more convenient for the Inhabitants of the Earth, if the Tropicks stood at a greater Distance, and the Sun moved further Northward and Southward, for so the North and South Parts would be relieved, and not exposed to so extreme Cold, and thereby rendred uninhabitable as now they are.

To this I Answer, That this would be more inconvenient to the Inhabitants of the Earth in general, and yet would afford the North and South Parts but little more comfort; for then as
much as the Distances between the Tropicks were enlarg’d, so much would also the Arctick and Antartick Circles be enlarg’d too; and so we here in England, and so on Northerly, should not have that grateful and useful Succession of Day and Night, but proportionally to the Sun’s coming towards us, so would our Days be of more than Twenty-four hours length, and according to his recess in Winter our Nights proportionable, which how great an inconvenience it would be, is easily seen. \textit{Whereas now the whole Latitude of the Earth, which hath at any time above Twenty-four hours Day, and}

*204
Twenty-four hours Night, is little and inconsiderable in comparison of the whole Bulk, as lying near the Poles. And yet neither is that Part altogether unuseful, for in the Waters there live Fishes, which otherwhere are not obvious, so we know the chief Whale-fishing is in Greenland:

<1717>Yea, not only Fish, but great varieties of Water-Fowl, both whole and cloven-footed, frequent the Waters, and feed there, breeding also on the Cliffs by the Sea-side, as they do with us: The Figures and Descriptions of a great many whereof are given us by Martin in his Voyage to Spitzberg, or Greenland.</1717>

And on the Land, Bears, and Foxes, and Deer, in that most Northerly Country that was ever yet touched, and doubtless, if we shall discover further to the very North-Pole, we shall find all that Tract not to be vain, useless, or unoccupied.

Thirdly, The third and last Thing I proposed was the Constitution and Consistency of the Parts of the Earth. And first, Admira[ble it is that the Waters should be gathered together into such great Conceptacula, and the dry Land appears, and though we had not been assured thereof by divine Revelation, we could not in Reason but have thought such a Division and Separation, to have been the Work of Omnipotence and infinite Wisdom and Goodness; for in this condition the Water nourishes and maintains innumerable Multitudes of various kinds of Fishes; and the dry Land supports and feeds as

*206
great variety of Plants and Animals, which have their firm Footing and Habitation: Whereas had all been Earth, all the Species of Fishes had been lost, and all those Commodities which the Water affords us; or all Water, there had been no living for Plants, or Terrestrial Animals, or Man himself; and all the Beauty, Glory, and Variety of this Inferior World had been gone, nothing being to be seen, but one uniform dark Body of Water: Or had all been mixt and made up of Water and Earth into one Body of Mud or Mire, as one would think should be most natural: For why such a Separation, as at present we find, should be made, no account can be given, but Providence. I say, had all this Globe been Mire or Mud, then could there have been no possibility for any Animals at all to have lived, excepting some few, and those very dull and inferior ones too. That therefore the Earth should be made thus, and not only so, but with so great variety of Parts, as Mountains, Plains, Vallies, Sand, Gravel, Limes Stone, Clay, Marble, Argilla, etc. which are so delectable and pleasant, and likewise so useful and convenient for the breeding, and living of various Plants and Animals; some affecting Mountains, some Plains, some Valleys, some Watery Places, some Shade, some Sun, some Clay, some Sand, some Gravel, etc. That the Earth should be so figured as to have Mountains in the Midland Parts; abounding with Springs of Water, pouring down Streams and

*207
Rivers for the Necessities and Conveniencies of the Inhabitants of the lower Countries and that the Levels and Plains should be formed with so easy a declivity as to cast off the Water and yet not render Travelling, or Tillage very difficult or laborious. These things, I say, must needs be the result of Counsel, Wisdom and Design. Especially when (as I said before) not that way which seems more facile and obvious to Chance is chosen, but that which is more difficult and hard to be traced, when it is most convenient and proper for those nobler Ends and Designs, which were intended by its Wise Creator and Governor.

Add to all this, that the whole dry Land is, for the most part, covered over with a lovely Carpet of Green Grass, and other Herbs, of a colour not only most grateful and agreeable, but most useful and salutary to the Eye; and this also decked and adorned with great variety of Flowers of beautiful Colours and Figures, and of most pleasant and fragrant Odours for the refreshment of our Spirits, and our innocent Delight.

As also with beautiful Shrubs, and stately Trees, affording us not only pleasant and nourishing, Fruits, many Liquors, Drugs, and good Medicines, but Timber and Utensils for all sorts of Trades, and the Conveniencies of Man. Out of many Thousands of which we will only just name a few, lest we should be tedious and too bulky.

First, The Coco, or Coker-Nut-Tree, that supplies the Indians with almost whatever they stand in need of; as Bread, Water, Wine, Vinegar, Brandy, Milk, Oyl, Honey, Sugar, Needles, Thread, Linen, Cloaths, Cups, Spoons, Beesoms, Baskets, Paper, Masts for Ships, Sails, Cordage, Nails, Coverings for their Houses, etc. Which may be seen at large in the many printed Relations of Voyages and Travels to the East Indies, but most faithfully in the <title>Hortus Malabaricus, published by that immortal Patron of Natural Learning, Henry Van Rheede van Draakenstein, who has had great Commands and Employs in the Dutch Colonies.

Secondly, The Aloe Muricata vel Aculeata, which yields the Americans every thing their Necessities require, as Fences and Houses, Darts, Weapons, and other Arms, Shoes, Linen, and Clothes, Needles and Thread, Wine and Honey, besides many Utensils, for all which Hernandes, Garcililasso de la Vega, and Margrave, may be consulted.

Thirdly, The Bandura Cingalensium, called by some the Priapus Vegetabilis, at the end of whose leaves hang long Sacks or Bags, containing a pure limpid Water of great use to the Natives, when they want Rain for eight or ten Months together.

A parallel Instance to this of the Bandura, my Learned and Worthy Friend Dr. Sloane affords

us in a Plant by him observed in the Island of Jamaica, and described by the Title of Viscum Caryophilloides Maximum flore tripetalo pallide luteo, semine filamentoso, which is commonly called, in that Island, Wild Pine, Philosoph.Transact. N. 251. Pag. 114. I shall not transcribe the whote Description, but only that Part of it which relates to this Particular:

“From the Root (which he had described before ) arise Leaves on every side, after the manner of Leeks, or Anana's, whence the Name of Wild-Pine, or Aloes, being folded or enclosed one within another, each of which a is two Foot and an half long, and from a three Inch breadth at Beginning, or base Ends in a Point, having a very hollow, or concave, inward Side, and a round, or convex, outward one: So that by all their hollow Sides is made
within a very large Preservatory, Cistern or Basin, fit to contain a pretty Quantity of Water, which in the rainy Season falls upon the utmost Parts of the spreading Leaves, which have Channels in them, conveying it down to the Cistern where it is a kept, as in a Bottle, the Leaves after they are swelled out like a bulbous Root to make the Bottle; bending inward or coming again close to the Stalk, by that means hindring the Evaporation of the Water, by the Heat of the Sun-Beams.

"In the mountainous, as well as the dry low Woods, in Scarcity of Water, this Reservatory

*210
" is not only necessary and sufficient for the Nourishment of the Plant itself, but likewise is very useful to Men, Birds, and all Sorts of Insects, whether in Scarcity of Water they come in Troops, and seldom go away without Refreshment.

"Captain Dampier in his Voyages, Vol. II. of Campeche (tell us) that these Basins made of the Leaves of the Wild Pine, will hold a Pint and half, or a Quart of Water, and that when they find these Pines, they stick their Knives into the Leaves just above the Roots, and that lets out the Water, which they catch in their Hats, as, saith he, I have done many times to my great Relief.

Fourthly, The Cinnamon-Tree of Ceylon, in whose Parts there is a wonderful Diversity: Out of the Root they get a Sort of Camphire, and its Oyl; out of the Bark of the Trunk, the true Oyl of Cinnamon; from the Leaves, an Oyl like that of Cloves; out of the Fruit a Juniper Oyl, with a Mixture of those of Cinnamon and Cloves; besides, they boil the Berries into a Sort of Wax, out of which they make Candles, Piaisters, Unguents. Here we may take Notice of the Candle-Trees of the West Indies, out of whose Fruit, boil'd to a thick fat Consistence, are made very good Candles, many of which have been lately distributed by that most ingenious Merchant, Mr. Charles Dubois.

*211
Fifthly, The Fountain, or Dropping-Trees, in the Isles of Ferro, St. Thomas, and in Guiny, which serve the Inhabitants instead of Rain and fresh Springs: My honoured Friend Dr Tancred Robinson, in a late Letter to me, is not of Vossius's Opinion, that these Trees are of the Ferulaceous Kind, because he observes, that by the Descriptions of Eye-witnesses, and by the dry'd Sample, lent by Paludanus, to the Duke of Wirtenberg, the Leaves are quite different From those of the Ferula's, coming nearer to the Seseli Ethiopicum Salicis vel Pericylymeni folio : Therefore the Doctor rather thinks them to be of the Laurel-kind, though he concludes here may be many different Sorts of these running Aqueous-Trees; because that Phaenomenon does not depend upon, or proceed from any Peculiarity of the Plant, but rather from the Place and Situation; of which he writes more at large, in a Letter printed in another Ditcourse of mine.

Sixthly, and Lastly, We will only mention the Names of some other Vegetables, which, with Eighteen of Twenty Thousand more of that Kind, do manifest to Mankind the illustrious Bounty and Providence of the Aimighty and Omniscient Creator, towards his undeserving Creatures; as the Cotton-Trees; the Manyoc, or Cassava; the Potatoe; the Jesuit's Bark-Tree; the Poppy; the Rhubarb; the Scammony;

*212
the Jalap; the Coloquintida; the China Sarfa; the Serpenatria Virginiana, or Snake-weed; the Nisi, or Genseg; the Numerose Balsam, and Gum-trees, many of which are of late must
illustrated by the great Industry and Skill of that most discerning Botanist, Dr. Leonard Plukenet.

Of what great Use all these, and innumerable other Plants, are to Mankind in the several Parts of Life, few or none can be ignorant; besides the known Uses in Curing Diseases, in Feeding and Cloathing the Poor, in Building, in Dying; in all Mechanicks there may be as many more not yet discovered, and which may be reserv'd on purpose to exercise the Faculties bestow'd on Man, to find out what is necessary, convenient, pleasant, or profitable to him.

To sum up all in brief: This Terraqueous Globe we know is made up of two Parts,

1. A thin and fluid.
2. A firm and consistent.

The former called by the Name of Water; the latter, of Earth, or dry Land. The Land being the more dense and heavy Body, doth naturally descend beneath the Water, and occupy the lower Place; the Water ascends and floats above it. But we see that it is not thus: For the Land, though the more heavy, is forcibly and contrary to its Nature so elevated as to cast off the Water, and stand above it, being

*213

(as the Psalmist phrases it) Founded upon, or above the Seas, and established above the Floods, Psalm. 24. 2. And this in such manner, that not only on one side of the Globe, but on all sides, there were probably continents; and Islands raised so equally as to counterbalance one another, the Water flowing between them, and filling the hollow and depressed Places. Neither was the dry Land only raised up, and made to appear, but some Parts (which we call Mountains) were highly elevated above others; and those so dispersed and situated (as we have shewn) in the mid-land Parts, and in continued Chains running East and West, as to render all the Earth habitable) a great Part whereof otherwise would not have been so; but the Torrid Zone must indeed have been such a Place as the Ancients fancied it, unhitable for Heat. Let us now consider how much better it is, that the dry Land should be thus raised up, and the Globe divided almost equally between Earth and Water, than that all its Surface should be one uniform and dark Body of Water. I say Water, because that naturally occupies the superior Place, and not Earth; for were it all Water; the whole Beauty on this inferior world were gone: There could be no such pleasant and delicious Prospects as the Earth now affords us; no Distinction and grateful Variety of Mountains and Hills, Plains and Valleys, Rivers and Pools, and Fountains; no shady Woods stored with lofty and towering

*214

Trees for Timber; lowly, and more spread ones, for Shade and Fruit: No amicable Verdure of Herbs, bespangled with an infinite variety of specious and fragrant Flowers: For those Plants that grow at the Bottom of the Sea, are for the most part of a dull, sullen and dirty Olive Colour, and bear no Flowers at all. Instead of the elegant Shapes and Colours, the Sagacity and Docility of ingenious Beasts and Birds, the musical Voices and Accents of the Aereal Choristers, there had been nothing but mute and stupid and indocile Fishes, which seem to want the very Sense of Discipline, as may be gathered from them that they are not Vocal, and that there appear in them no Organs of Hearing: It being also doubtful whether the Element they live in be capable of transmitting Sounds, the best Sense they have, even their Sight, can be but dull and imperfect; the Element of Water being Semipake, and reflecting a good Part of the Beams of Light. The most noble and ingenious Creatures that
live there, the Cetaceous Kind, being near akin to Terrestrial Animals, and breathing in the samme Element, the open Air.

Had, I say, all been Water, there had been no Place for such a Creature as Man; as we see there is no such there: There is no Business for him, no Subject to employ his Art and Faculties, and consequently there could be no Effects of them; no such things as Houses and Cities, and stately Edifices, as Gardens and Orchards, and Walls,

*215
Walks and Labyrinths, as Corn-fields, and Vineyards, and the rest of these Ornaments, wherewith the Wit and Industry of Man hath embellished the World.

These are great Things, and worthy the Care and Providence of the Creator; which whoso considereth, and doth not discern and acknowledge, must needs be as stupid as the Earth he goes upon.

But because Mountains have been look’d upon by some as Warts, and superfluous Excrescencies, of no Use or Benefit; nay, rather as Signs and Proofs, that the present Earth is nothing else but a heap of Rubbish and Ruins, I shall reduce and demonstrate in Particulars, the great Use, Benefit, and Necessity of them.

I. They are of eminent Use for the Production and Original of Springs and Rivers. Without Hills and Mountains there could be no such Things, or at least but very few: No more than we now find in plain and level Countries; that is, so few, that it was never my Hap to see one. In Winter time indeed, we might have Torrents and Land-floods, and perhaps sometimes great Inundations, but in Summer nothing but stagnating Water, reserved in Pools and Cisterns, or drawn up out of deep Wells. But as for a great Part of the Earth (all lying within, or near the Tropicks) it would neither

*216 have Rivers, nor any Rain at all: We should consequently lose all those Conveniencies and Advantages that Rivers afford us, of Fishing, Navigation, Carriage, Driving of Mills, Engines, and many others. This end of Mountains I find assigned by Mr. Edmund Halley, a Man of great Sagacity and deep Insight into the Natures and Causes of Things, in a Discourse of his Published in the Philosoph. Transactions, Numb. 192. in these Words: This, if we may allow final Causes, fier [ Hardiment, the Thing is clear, pronounce boldly without any Ifs or Ands ] This seems to be one Design of the Hill, that their Ridges being placed through the midst of their Continents, might serve as it were Alembicks, to distil Fresh Water for the Use of Man and Beast; and their Heights to give a descent to those Streams, to run gently, like so many Veins of the Microcosm, to be the more beneficial to the Creation.

II. They are of great Use for the Generation, and convenient digging up of Metals and Minerals; which how necessary Instruments they are of Culture and Civility I have before shewn. These we see are all digged out of Mountains and I doubt whether there is, or can be any Generation of them, in perfectly plain and level Countries: But if there be, yet could not such Mines, without great Pains and Charges, if at all, be wrought; the Delfs would be so flown with Waters ( it being impossible to make any

*217 Addits or Soughs to drain them) that no Gins or Machines could suffice to lay and keep them dry.
III. They are useful to Mankind in affording them convenient Places for Habitation and Situations of Houses and Villages, serving as Skreens to keep of the cold and nipping Blasts of the Northern and Easterly Winds, and reflecting the benign and cherishing Sun-beams, and so rendering their Habitations both more comfortable and more clearly in Winter; and promoting the Growth of Herbs and Fruit trees, and the Maturation of their Fruits in Summer. Besides casting off the Waters, they lay the Gardens, Yards, and Avenues to the houses dry and clean; and so as well more Salutary, as more Elegant. Whereas Houses built in Plains, unless shaded with Trees, lie bleak and exposed to Wind and Weather, and all Winter are apt to be grievously annoyed with Mire and Dirt.

IV. They are very Ornamental to the Earth, affording pleasant and delightful Prospects, both, 1. To them that look downwards from them, upon the subjacent Countries; as they must needs acknowledge, who have been but on the Downs of Sussex, and enjoyed that ravishing Prospect of the Sea on one Hand, and the Country far and wide on the other. And, 2. To those that look upwards and behold them from the Plains, and low Grounds; which what a Refreshing and Pleasure it is to the Eye, they are best able to judge who have lived in the Isle of Ely, or other level Countries, extending on all Sides further than one can ken; or have been out far at Sea, where they can see nothing but Sky and Water. That the Mountains are pleasant Objects to behold, appears, in that the very Images of them, their Draughts and Landskips, are so much esteemed.

V. They serve for the Production of great Variety of Herbs and Trees; for it is a true Observation, That Mountains do especially abound with different Species of Vegetables because of the great Diversity of Soils that are found there, every Vertex, or Eminency, almost affording new Kinds. Now these Plants serve partly for the Food and Sustenance of such Animals as are proper to the Mountains, partly for Medicinal Uses; the chief Physick herbs and Roots, and the best in their Kinds growing there: It being remarkable, That the greatest and most luxuriant Species in most Genera of Plants are Native of the Mountains: Partly also for the Exercise and Diversion of such ingenious and industrious Persons, as are delighted in searching out these natural Rarities; and observing the outward Form, Growth, Natures, and Uses, of each Species, and reflecting upon the Creator of them his due Praises and Benedictions.

VI. They serve for the Harbour, Entertainment, and Maintenance of various Animals, Birds, Beasts, and Insects, that breed, feed and frequent there; for the highest Tops and Pikes of the Alps themselves, are not destitute of their Inhabitants, the Ibex, or Stein-buck, the Rupicapra, or Chamois, among Quadrupeds; the Lagopus among Birds; and I myself have observed beautiful Papilio's, and store of other Insects, upon the Tops of some of the Alpine Motmtains. Nay, the highest Ridges of many of those Mountains, serve for the Maintenance of Cattle for the Service of the Inhabitants of the Vallies: The Men there leaving their Wives, and younger Children. below, do not, without some Difficulty, clamber up the Acclivities, dragging their Kine with them, where they feed them, and milk them, and make Butter and Cheese, and do all the Daiery-work, in such sorry Hovels and Sheds as they build there to inhabit in during the Summer Months: This I myself have seen and observed in Mount Jura, not far from Geneva, which is high enough to retain Snow all the Winter. The same they do also in the Grisons Country, which is one of the highest Parts of the Alps, travelling through which I did not set Foot off Snow for four Days Joulney, at the latter End of March.
VII. Those long Ridges and Chains of lofty and topping Mountains, which run through the whole Continents East and West, (as I have elsewhere observed) Serve to stop the Evagation of the Vapours to the North and South in hot Countries, condensing them like Alembick Heads into Water, and so by a kind of external Distillation giving Original to Springs and Rivers; and likewise by amassing, cooling, and constipating of them, turn them into Rain; by those Means rendering the fervid Regions of the Torrid Zone habitable.

This Discourse concerning the Use of Mountains, I have made use of in another Treatise, The Dissolution of the World; but because it is proper to this Place, I have, with some Alterations and Enlargements, here repeated it.

I had almost forgotten that Use they are of to Mankind, in serving for Boundaries and Defences to the Territories of Kingdoms and Common-wealths.\textendash{1717}

A second Particular I have made choice of more exactly to survey and consider, is the Body of Man: Wherein I shall endeavour to discover something of the Wisdom and Goodness of God; First, by making some general Observations concerning the Body. Secondly, by running over and discoursing upon its principal Parts and Members.

I. Then in general, I say, the Wisdom and Goodness of God appears in the erect Posture of the Body of Man, which is a Privilege and Advantage given to Man, above other Animals. But though this be so, yet I would not have you think, that all the Particulars I shall mention are proper only to the Body of Man, divers of them agreeing to many of the Creatures. It is not my Business to consider only the Prerogatives of Man above other Animals, but the Endowments and Perfection which Nature hath conferred on his Body though common to them with him. Of this Erection of the Body of Man, the Ancients have taken Notice as a particular Gift and Favour of God.

\textit{Pronaq; cum spectent Animalia caetera terram, Os homini sublime dedit, coelumq; tueri Jussit, et erectos ad Sydera tollere vultus.} Ovid. Metamorphoses.I.

\textit{And before him, Tully in his second Book, De Nat. Deorum.}

\textit{Ad hanc providentiam naturae tam diligentem tamq; solertem adjungi multa possunt, quibus intelligatur quantae res hominibus Deo, quamq; eximiae tributae sunt, qui primum eos humo excitatos, celsos et erectos constituit, ut Deorum cognitionem caelum intuentes capere possent. Sunt enim terra homines, non ut incolae atq; habitatores,}

sed quasi spectatores superarum rerum atq; coelestium, quarum spectaculum ad nullum aliud genus animantium pertinent.\textendash{152}

Man being the only Creature in this sublunary World, made to contemplate Heaven, it was convenient that he should have such a Figure or situs of the Parts of his Body, that he might conveniently look upwards. But to say the Truth in this respect of contemplating the Heavens, or looking upwards, I do not see what Advantage a Man hath by this Erection above other Animals, the Faces of most of them being more supine than ours, which are
only Perpendicular to the Horizon, whereas some of theirs stand reclining. But yet two or three other Advantages we have of this Erection, which I shall here mention.

First, it is more Commodious for the sustaining of the Head, which being full of Brains, and very heavy (the Brain in Man being far larger in Proportion to the Bulk of his Body, than in any other Animal) would have been very painful and wearisome to carry, if the Neck had lain parallel or inclining to the Horizon.

Secondly, This Figure is most convenient for Prospect, and looking about one. A Man may see further before him, which is no small Advantage for avoiding Danger, and discovering whatever he searches after.

Thirdly, The Conveniency of this Site of our Bodies will more clearly appear, if we consider what a pitiful Condition we had been in if we had been constantly necessitated to stand and walk upon all Four; Man being by the Make of his Body, of all Quadrupeds (for now I must compare him with them) the most unfit for that kind of incessus, as I shall shew anon. And besides that, we should have wanted, at least in a great Measure, the Use of our Hand, that unvaluable Instrument, without which we had wanted most of those Advantages we enjoy as reasonable Creatures, as I shall more particularly demonstrate afterwards.

But it may be perchance objected by some, that Nature did not intend this Erection of the Body, but that it is superinduced and artificial; for that Children at first creep on all Four, according to that of the Poet,

To which I Answer, that there is so great an Inequality in the Length of our Legs and Arms, as would make it extremely inconvenient, if not impossible, for us to walk up on all Four, and set us almost upon our Heads; and therefore we see that Children do not creep upon their Hands and Feet, but upon their Hands and Knees; so that it is plain that Nature intended us to walk as we do, and not upon all Four.

To which I Answer, that there is so great an Inequality in the Length of our Legs and Arms, as would make it extremely inconvenient, if not impossible, for us to walk up on all Four, and set us almost upon our Heads; and therefore we see that Children do not creep upon their Hands and Feet, but upon their Hands and Knees; so that it is plain that Nature intended us to walk as we do, and not upon all Four.

2. I argue from the Situs, or Position of our Faces; for had we been to walk upon all Four, we had been the most prone of all Animals, our Faces being parallel to the Horizon, and looking directly downwards.

3. The Greatness and Strength of the Muscles of the Thighs and Legs above those of the Arms, is a clear Indication that they were by Nature intended for a more difficult and laborious Action, even the moving and transferring the whole Body, and that Motion to be sometimes continued for a great while together.

As for that Argument taken from the contrary Flexure of the Joints of our Arms and Leas to that of Quadrupeds, as that our Knees bend forward, whereas the same joint of their Hindlegs bends backward; and that our Arms bend backward, whereas the Knees of their Fore-legs bend forward. Although the Observation be as old as Aristotle, because I think there is a Mistake in it, in not comparing the same Joints (for the First or uppermost joint in a Quadruped's Hind-legs bends forward, as well as a Man's Knees, which Answer to it,
being the uppermost Joint of our Legs; and the like mutatis mutandis may be said of the Arms) I shall not insist upon it.

*225

<1717>Another Particular which may serve to demonstrate that this erect Posture of the Body of Man was intended and designed by the Wise and Good Author of Nature, is the Fastning of the Cone of the Pericardium to the Midriff: An Account whereof I shall give the Reader out of the ingenious Dr. Tyson's Anatomy of the Orang-Outang, or Pygmie, p. 49.

Vesalius (saith he) and others make it a Peculiarity to Man, that the Pericardium, or Bag that incloses the Heart, should be fastned to the Diaphragm. Vesalius tells us, (De Corporis Humani fabrica, lib. 6. cap. 8.) <latin>Caeterum involucri mucro, et dextri ipsius lateris egregia portio Septi transversi nerveo circulo validissime amplyque admodum spatio connascitur, quod Hominibus est peculiare.</latin>

The Point of the Pericardium, and a very considerable Portion of its right side, is most firmly fastned to the nervous Circle of the Midriff for a large Space, which is peculiar to Mankind.

So Blancardius Anat. reformat. cap. 2. p. 8. <latin>Homo prae caeteris Animalibus hoc peculiare habet, quod eius Pericardium Septi transversi medio semper, accrescat cum idem in Quadrupedum genere librum et aliquanto spatio ab ipso remtum sit: Man hath this peculiar to him, and different from other Animals, that his Pericardium doth always grow to the Middle of the Midriff; whereas in the Quadruped-kind it is free and removed some Distance from it.

The Pericardium in Man is therefore thus fastned, that in Expiration it might assist the

*226

Diastole of the Diaphragm: For otherwise the Liver and Stomach being so weighty, they would draw it down too much towards the Abdomen, so that, upon the Relaxation of its Fibres in its Diastole, it would not ascend sufficiently into the Thorax, so as to cause a Subsidency of the Lungs by lessening the Cavity there.

In Quadrupeds there is no need of this Adhesion of the Pericardium to the Diaphragm; for in them, in Expiration, when the Fibres of the Diaphragm are relaxed, the Weight of the Viscera of the Abdomen will easily press the Diaphragm up into the Cavity of the Thorax, and so perform that Service. Besides, were the Pericardium fastned to the Diaphragm in Quadrupeds, it would hinder its Systole in Inspiration, or its Descent downwards upon the Contraction of its Muscular Fibres; and the more, because the Diaphragm being thus tied up, it could not then so freely force down the Weight of the Viscera, which are always pressing upon it, and consequently not sufficiently dilate the Cavity of the Thorax, and therefore must hinder their Inspiration. Thus we see how necesary it is, that in Man, the Pericardium should be fastened to the Diaphragm, and in Quadrupeds how inconvenient it would be.

And since we find this Difference between the Hearts of Brutes and Men in this particular, how can we imagine but that it must needs be the Effect of Wisdom and Design, and that Man was intended by Nature to walk erect, and not upon all Four, as Quadrupeds do?  
</1717><1691=155>

*227
II. The Body of Man may thence be proved to be the Effect of Wisdom because there is nothing in it deficient, nothing, superfluous, nothing but hath its End and Use. So true are those Maxims we have already made use of, *Natura nihil facit frustra, and Natura non abundat in superfluis, nec deficit in necessariis,* no Part that we can well spare. "The Eye cannot say to the Hand, I have no need of thee, nor the Head to the Feet I have no need of you," I Cor. xii. 21. that I may usurp the Apostle's Similitude.

The Belly cannot quarrel with the Members, nor they with the Belly for her seeming Sloth; As they provide for Meat for her, so she concocts and distributes it to them. Only it may be doubted to what use the Paps its Men should serve. I Answer, partly for Ornament, partly for a kind of Conformity between the Sexes, and partly to defend and cherish the Heart; in some they contain Milk, as in a Danish Family we read of in Bartholines Anatomical Observations. However, it follows not that they or any other Parts of the Body are useless because we are ignorant.

*I have lately met with a Story in Seignior Paulo Boccone his Natural Observations, printed at Bologna in Italy, 1684. well attested, concerning a Country-man, called Billardino di Billo, living in a Village belonging to the City of Nocera in Umbria, called Somareggio, whose Wife dying, and leaving a young Infant, he nourished it with his own Milk. This Man, either because in the small Village where he lived there was not a wet Nurse to be had, or because he was not able to hire one, took the Child, and applying it to his own Bosom, and putting the Nipples of his Breasts into its Mouth, invited it to suck, which the Infant did, and after divers times drawing, fetch'd some Milk; whereat the Father encouraged, continued to apply it, and so after a while it brought down the Milk so plentifully as to nourish it for many Months, till it was fit to be weaned. Hereupon my Author having proved by sufficient Authority of able Anatomists, such as Franciscus Maria Florentinus, and Marcellus Malpighius, that the Paps of Men have the same Structure and the same Vessels with those of Women, concludes, that Nature hath not given Paps to Men, either to no Purpose, or for meer Ornament, but, if Need requires, to supply the Defect of the Female, and give Suck to the Young.

Had we been born with a large Wen upon our Faces, or a Bavarian Poke under our Chins, or a great Bunch upon our Backs like Camels, or any the like superfluous Excrescency; which should be not only useless but troublesome, not only Stand us in nostead, but also be ill-favoured to behold, and burdensome to carry about, then we might have had some Pretence to doubt whether an intelligent and bountiful Creator had been our Architect; for had the Body been made by Chance, it must in all Likelihood have had many of these superfluous and unnecessary Parts.

But now seeing there is none of our Members but hath its Place and Use, none that w could spare, or conveniently live without were it but those we account Excrements, *the Hair of our Heads, or the Nails on our Fingers ends*; we must needs be mad or sottish if we can conceive any other than that an infinitely Good and Wise God was our Author and Former;

III. We may fetch an Argument of the Wisdom and Providence of God from the convenient Situation and Disposition of the Parts and Members of our Bodies: They are seated most
conveniently for Use, for Ornament, and for mutual Assistance. First, for Use; so we see the
Senses of such eminent Use for our Well-being, situate in the Head, as Sentinel in a Watch-
Tower, to receive and convey to the Soul the Impressions of External Objects.

*Sensus autem interpretes ac nuntii rerum in capite tanquam in arce mirifice ad usus
necessarios et facti et collati sunt.* Cicero. de Nat. Deorum. The Eye can more easily
see Things at a Distance, the Ear receives Sounds from afar: How could the Eye have been
better placed either for Beauty and Ornament, or for the Guidance and Direction of the
whole Body. As Cicero proceeds well, *Nam Oculi tanquam speculatores altissimum
locum obtinent, ex quo plurima conspicientes funguntur suo munere:*

*230*  
Et Aures quoque sonum recipere debent, qui natura in sublime fertur, recte in altis corporum
partibus collocatae sunt; itemq; Nares, *eo quo omnis odor ad superiora fertur, recte
sursum sunt.* Cicero. de Nat. Deorum. For the Eyes, like Sentinels occupy the highest Place, from whence
seeing many things they perform their Functions: And the Ears, which are made for the
Reception of sounds, which naturally are carried upwards, are rightly placed in the
uppermost Parts of the Body; also the Nostrils, because all Odors ascend, are fitly situate in
the superior Parts.

I might instance in the other Members: How could the Hands have been more conveniently
placed for all Sorts of Exercises and Works, and for the Guard and Security of the Head and
principal Parts? The Heart, to dispense Life and Heat to the whole Body, viz. near the
Center, and yet because it is harder for the Blood to ascend than descend, somewhat nearer
the Head. It is also observable, that the Sinks of the Body are removed as far from the Nose
and Eyes as may be, which Cicero takes Notice of in the fore-mentioned Place.

*231*  
Secondly, For Ornament. What could have been better contrived, than that those Members
which are Pairs, should stand by one another in equal Altitude, and *answer on each
Side one to another?* And,

Thirdly, For mutual Assistance. We have before shewed how the Eye stands most
covieniently for guiding the Hand, and the Hand for defending the Eye; and the like might
be said of the other Parts, they are so situate to afford Direction and Help one to another.
This will appear more clearly, if we imagine any of the Members situate in contrary Place or
Positions; Had a Man's Arms been fitted only to bend backwards behind him; or his Leg
only to move backwards, what Direction could his Eyes then have afforded him in Working
or Walking? Or how could he then have fed himself? Nay, had one Arm been made to
bend forward, and the other directly backward, we had then lost half the Use of them since
they could not have assisted one the other in any Action. Take the Eyes, or any other of the
Organs of Sense, and see if you can find any so convenient a Seat for them in the whole
Body, as that they now possess.

*IV. From the ample Provision that is made for the Defence and Security of the principal
Parts: Those are, I. The Heart; which is the Fountain of Life and Vegetation,*

*Officina spirituum vitalium, principum et fons caloris nati, lucerna humidi
radicalis;* and that I may speak with the Chymists, *ipse Sol Microcosmi,*
the very Sun of the Microcosme or little World, in which is contained that Vital Flame or Heavenly Fire, which Prometheus is fabled to have stole from Jupiter; or as Aristotle phrases it, that <greek> Aialogon tO tOn aplanOn zoicheiO </greek>, <latin> Divinum quid respondens Elemento Stellarum </latin>. This for more Security is situate in the Center of the Trunk of the Body, covered first with its own Membrane, called Pericardium, lodged within the soft Bed of the Lungs, encompassed round with a double Fence, (1.) Of firm Bones or Ribs to bear off Blows: (2.) Of thick Muscles and Skins, Besides the Arms, conveniently placed to fence of any Violence at a Distance before it can approach to hurt it.

2. The Brain, which is the Principle of all Sense and Motion, the Fountain of the Animal Spirits, the chief Seat and Palace Royal of the Soul upon whose Security depends whatever Privilege belongs to us as Sensitive or Rational Creatures. This, I say, being the prime and immediate Organ of the Soul, from the right Constitution whereof proceeds the Quickness of Apprehension, Acuteness of Wit, Solidity of Judgment, Method and Order of Invention, Strength and Power of Memory; which if once weakened and Disordered, there follows nothing but Confusion and Disturbance in our Apprehensions, Thoughts and Judgments, is environed round about with such a potent Defence, that it must be a mighty Force indeed that is able to injure it.

1. A Skull so hard, thick, and tough, that it is almost as easy to split a Helmet of Iron as to make a Fracture in it.

2. This covered with Skin and Hair, which serve to keep it warm, being naturally a very cold Part, and

also to quench and dissipate the Force of any Stroke that shall be dealt it, and retund the Edge of any Weapon.

3. And yet more than all this, there is still a thick and tough Membrane which hangs looser about it, and doth not so closely embrace it, (that they call dura mater) and in case the Skull happens to be broken, doth often preserve it from Injury and Diminution: And, lastly, a thin and fine Membrane strait and closely adhering, to keep it from quashing and shaking.

I might instance (3.) in the Lungs, which are so useful to us, as to Life and Sense, that the Vulgar think our Breath is our very Life and that we breathe out our Souls from thence. Suitable to which Notion, both anima and spiritus in Latin, and pneuma in Greek, are derived from Words that signify **162** Breath and Wind: And esclare or exhalare animam signifies to die. And the old Romans used to apply Mouth to Mouth, and receive the last Gasp of their dying Friends, as if their Souls had come out that way. From hence, perhaps, might first spring that Opinion of the Vehicles of Spirits; the Vulgar, as I hinted before, conceiving that the Breath was, if not the Soul itself, yet that wherein it was wafted and carried away. These Lungs,

I say, are, for their better Security and Defence, shut up in the same Cavity with the Heart.
V. In the abundant Provison that is made Against evil Accidents and Inconveniences. And the Liberality of Nature, as to this Particular, appears, 1. In that she hath given many Members, which are of eminent Use, by Pairs, as two Eyes, two Ears, two Nostrils, two Hands, two Feet, two Breasts, [Mammae] two Reins; that so, if by any cross or unhappy Accident one should be disabled or rendred useless, the other might serve us tolerably well; whereas had a Man but one Hand, or one Eye, etc. if that were gone, all were gone, and we left in an evil Case. See then, and acknowledge the Benignity of the Deity, who hath bestowed upon us two Hands, and two Eyes, and other the like Parts, not only for our Necessity but Conveniency, so long as we enjoy them; and for our Security, in case any Miscance deprive us of one of them. 2. In that all the Vessels of the Body have many Ramifications: Which particular Branches, though they serve mainly for one Member or Muscle, yet send forth Some Twigs to the neighbouring Muscles; and so interchangeable the Branches that serve these, send to them. So that if one Branch chance to be cut off or obstructed, its Defect may, in some measure, be supplied by the Twigs that come from the neighbouring Vessels. 3. In that she hath provided

So many ways to evacuate what migh be hurtful to us, or breed Diseases in our Bodies. If any thing oppress the Head, it hath a Power to free itself by Sneezing: If any thing fall into the Lungs, or if any Humour be discharg’d upon them, they have a Faculty of clearing themselves, and casting it up by Coughing: If any thing clog or burden the Stomach it hath an Ability of contracting itself, and throwing it up by Vomit. Besides these ways of Evacuation, there are Siege, Urine, Sweating, Haemorrhogies from the Nose, and Haemorrhoidal Veins, Fluxes of Rheum. Now the Reason why Nature hath provided so many ways of Evacuation, is, because of the different Humours that are to be voided or cast out. When therefore there is a Secretion made of any noxious Humour, it is carried off by that Emunctory whose Pores are fitted to receive and transmit the minute Parts of it; if at least this Separation be made by Percolation, as we will now suppose, but not assert. Yet I doubt not but the same Humour may be cast off by divers Emunctories, as is clear in Urine and Sweat which are for the main the same Humour carried off several ways,

To this Head of Provision against Inconveniences, I shall add an Observation or two concerning Sleep.

I. Sleep being necessary to Man and other Animals for their Refreshment, and for the Reparation of that great Expence of Spirits, which

is made in the day-time, by the constant Exercise of the Senses and Motions of the Muscles, that it might ease and refresh us indeed; Nature hath provided, that tho' we lie long upon one side, we should have no Sense of Pain or Uneasiness during our Rest, no, nor when we awake. Whereas in Reason one would think, that the whole Weight of the Body pressing the Muscles and Bones on which we lie, should be very burdensome and uneasy, and create a grievous Sense of Pain; and we find by Experience that it doth so, when we lie long awake in the Night, we being not able (especially if never so little indisposed) to rest one quarter of an Hour in the same Posture without shifting of Sides, or at least etching this way and that way, more or less. How this may be effected is a great Question. To me it seems most probable, that it is done by an Inflation of the Muscles, whereby they become both soft, and yet renitent like so many Pillows, dissipating the Force of the Pressure, and so preventing or taking away the Sense of Pain. That the Muscles are in this manner inflated in time of Rest, appears to the very Eye in the Faces of Children, and may be proved from that when we Rest in our Clothes, we are fain to loosen our Garters, Shoo-Strings, and other Ligatures, to give
the Spirits free Passage, else we shall experience Pain and Uneasiness in those Parts, which when we are waking we find not.

*237

The Reason of this Phaenomeon, viz. that <greek>analgesia</greek>, or want of Pain, we experience in Sleep, during and after a long decubitus on one Side, Dr. Lister in his *Journey to Paris*, p.113. and Dr. Jones in his Treatise of the Mysteries of Opium revealed, attribute to the Relaxation of the Nerves and Muscles in time of Sleep; and the Sense of Pain and Uneasiness when we lie awake to the Tension of them during that time. This I do not deny, but yet I think the Reason I have assigned hath a great Interest in that Rest and Easiness we enjoy when asleep.

2. Because Sleep is inconsistent with the Sense of Pain, therefore during Rest, those Nerves which convey that Motion to the Brain, which excites in the Soul a Sense of Pain, are obstructed. This I myself have had frequent Experience of, since I have been troubled with Sores on my Legs. Upon sudden awakening, finding myself at perfect Ease, and void of all Sense of Pain for a Minute’s time or more, the Pain then by degrees returning, which I could attribute to nothing but the dissipating that Vapour, or whatever else it were, which obstructed the Nerves, and giving the dolorific Motion free Passage again.

Upon second Thoughts, and reading what Dr. Lister and Dr. Jones have written concerning this Subject, I rather incline to believe, that the Motion causing a Sense of Pain, is convey’d to the brain by the Nerves themselves in Tension,

*238

as we see in Cords, any the least Touch at one End passes Speedily to the other when they are stretch’d, which it doth not when they are relaxed, and not by the Spirits passing through them: And on the other side, the Unsensibleness of Pain proceeds rather from the Relaxation of the Nerves than their Obstruction. But yet this Tension of the Nerves and Muscles is owing to the Spirits flowing down into them, and distending them. </1717><1691=164>

VI. From the Constancy that is observed in the Number, Figure, Place, and Make of all the principal Parts; and from the Variety in the less. Man is always mending and altering his Works: But Nature observes the same Tenor, because her Works are so perfect, that there is no Place for Amendments; nothing that can be reprehended. The most Sagacious Men in so many Ages, have not been able to find any Flaw in these Divinely contrived and formed Machines, no Blot or Error in this great Volume of the World, as if any thing had been an imperfect Essay at the first, to use the Bishop of Chester's words: Nothing that can be altered for the better; nothing but if it were altered would be marred. This could not have been, had Man's Body been the Work of Chance, and not Council and Providence. Why should there be constantly the same Parts? Why should they retain constantly the same Places? And why should they be endued with the same Shape and Figure? Nothing so contrary

*239

as Constancy and Chance. Should I see a Man throw the same Number a thousand times together upon but three Dice, could you Persuade me that this were Accidental, and that there was no necessary Cause of it? How much more incredible then is it, that Constancy in such a Variety, such a Multiplicity of Parts, should be the Result of Chance? Neither yet can these Works be the Effects of Necessity or Fate, for then there would be the same Constancy observed in the Smaller as well as the larger Parts and Vessels; whereas there we see Nature doth ludere, as it were, sport itself; the minute Ramifications of all the Vessels,
Veins, Arteries, and Nerves, infinitely varying in Individuals of the same Species, so that they are not in any two alike.

VII. The great Wisdom of the Divine Creator appears, in that there is Pleasure annexed to those Actions that are necessary for the Support and preservation of the Individuum, and the Continuation and Propagation of the Species; and not only so, but Pain to the Neglect or Forbearance of them. For the Support of the Person, it hath annex'd Pleasure to Eating and Drinking; which else, out of Laziness or Multiplicity of Business, a Man would be apt to neglect, or sometimes forget. Indeed, to be obliged to chew and swallow Meat daily for two Hours space, and to find no relish or pleasure in it, would be one of the most burdensome and ungrateful Tasks of a Man's whole Life. But because this Action is absolutely necessary, for abundant security Nature hath inserted in us a Painful sense of Hunger to put us in mind of it, and to reward our Performance hath adjoined Pleasure to it. And as for the Continuation of Kind, I need not tell you, that the Enjoyments which attend those Actions are the highest Gratifications of Sense.

VIII. The wonderful Art and Providence of the Contriver and Former of our Bodies, appears in the Multitude of Intentions he must have in the Formation of the several Parts, or the Qualifications they require, to fit them for their several Uses. Bishop of chester, Nat Rel. lib.1. c.6. Galen in his book De Formatione Foetus, **takes notice, That there are in a humane Body above Six hundred several Muscles, and there are at least Ten several Intentions or due Qualifications to be observed in each of these; proper Figure, just Magnitude, right Disposition of its Several Ends, upper and lower, Potition of the whole, the Insertion of its proper Nerves, Veins, and Arteries, which are each of them to be duly placed; so that about the Muscles alone, no less than Six thousand several Ends or Aims are to be attended to. The Bones are reckoned to be 284. The distinct Scopes or Intentions in each of these are above 40, in all about 100,000. And thus it is in some Proportion with all the other Parts, the Skin, Ligaments, Vessels, Glandules, Humors:

Now to imagine that such a Machine composed of so many Parts, to the right Form, Order and Motion whereof such an infinite Number of Intentions are required, could be made without the Contrivance of some Wise Agent, must needs be irrational in the highest Degree.

<1717>This wonderful Mechanism of humane Bodies, next to viewing the Life, may be seen at large in the excellent Figures of Spigelius and Bidloo; their Situation, Order, Connexion and Manner of separating them, in Lyserus his Cult. Anatom. The almost infinite Ramifications, and Inosculations of all the several sorts of Vessels, the Structures of the Glands, and other Organs, may easily be detected by Glasses, and trac'd by blowing in of Air, and drawing them, or by injecting through peculiar Syringes, melted Wax, or Quicksilver; the Operations whereof may be learnt out of Swammerdam, Caspar Bartholine, and Antonio Nuck.
IX. Another Argument of Wisdom and Design in Contrivance of the Body of Man, and other Animals, is the Fitting of some Parts to divers Offices and Uses, whereby Nature doth

*(as the Proverb is) *<latin>Una fidelia duos parietes dealbare</latin>*; Stop two Gaps with one Bush. So, for Instance, the Tongue serves not only for Tasting, but also to assist the Mastication of the Meat and Deglutition, by turning it about, and menaging it in the Mouth, to gather up the Food in Man by licking; in the Dog and Cat-kind by lapping; in Kine, by plucking up the Grass: Particularly in Man, it is of admirable Use for the Formation of Words and Speaking.

The Diaphragm and Muscles of the Abdomen, or lower Belly, are of Use, not only for Respiration, but also for compressing the Intestines, and forcing the Chyle into the lacteal Veins, and likewise out of the said Veins into the thoracick Chanel: And here, to note that by the way, appears the Use of a common receptacle of Chyle, that by the Motion of the Muscles of Respiration, it being pressed upon, the Chyle might with more facility be impelled into the foremention'd Duct. Besides, this Action of Respiration and Motion of the said Diaphragm and Muscles, may serve also for the Commination and Concoction of the Meat in the Stomach (as some, not without Reason, think) by their constant Agitation and Motion upwards and downwards, resembling the pounding or braying of Materials in a Mortar.

And to instance in no more, the muscular Contraction and Pulse of the Heart serves not only for the Circulation of the Blood, but also for

*243
for the more perfect Mixture of its Parts, preserving its due Crasis and Fluidity, and incorporating the Chyle and other Juices it receives with it.

X. The Wisdom and Goodness too of the Divine Former of our Bodies appears in the Nourishment of them: For that Food which is of a wholesome Juice, and proper to nourish and preserve them in a healthful State, is both pleasant to the Taste, and grateful and agreeable to the Stomach, and continues to be so till our Hunger and Thirst be well appeased, and then begins to be less pleasant, and at last even nauseous and loathsome. The full stomach loathes the Honey-comb.

On the other side, that which is unwholsome and unfit for Nourishment, or destructive of Health, is also unpleasant to the Taste, and ungrateful and disagreeable to the Stomach, and that more or less according as it is more or less improper or noxious. And though there be some sorts of Food less Pleasant to the Taste, which by Use may be rendred grateful; yet to Persons that are in Health, and in no necessity of using such Viands, I think it were better to abstain from them, and follow Nature in eating such Things as are agreeable to their Palate and Stomach: For such unpleasant Diet must needs alter the Temper of the Body, before it can become acceptable; and doubtless for the worse.

*244
I might add hereto, that even Pain, which is the most grievous and afflictive thing that we are sensible of, is of great use to us. God hath annexed a Sense of Pain to all Diseases and Harms of the Body inward and outward, (and there is no Pain but proceeds from some Harm or Disease) to be an effectual Spur to excite and quicken us to seek for speedy Help or Remedy; and hath so order'd it, that ae the Disease heals, so the Pain abates. Neither doth Pain provoke us only to seek ease and Relief when we labour under it, but also makes us
careful to avoid for the future all such things as are productive of it; that is, such things as are hurtful to our Bodies, and destructive of the Health and Well-being of them, which also are, for the most part, prohibited by God, and so sinful and injurious to our Souls.

So we see what Care the Divine Providence hath taken, and what effectual Means it hath used for the Healing of our Diseases, and the maintenance and Preservation of our Health. This is the true Reason of Pain: Howbeit, I will not deny, but that God doth sometimes Himself immediately inflict Diseases, even upon his own Children, for many good Considerations which I shall not here enumerate. Neither shall I mention the Uses that Parents and Masters make of it, for the correcting their Children and Servants, or Magistrates for the punishing of Malefactors, they being beyond my Scope; only I cannot but take Notice, that it is a thing of manifold Uses, and necessary for the Government both of Commonwealths and Families. </1717>

*245

necessar for the Government both of Commonwealths and Families. </1717>

<**168><1691 Eighthly>

XI. Some fetch an Argument of Providence from the Variety of Lineaments in the Faces of Men, which is such, that there are not two Faces in the World absolutely alike; which is somewhat strange, since all the Parts are in Species the same. Were Nature a blind Architect, I see not but the Faces of some Men might be as like, as Eggs laid by the same Hen or Bullets cast in the same Mould, or Drops of Water out of the same Bucket. This Particular I find taken notice of by Pliny in his Seventh Book, Cap. I. in these Words: <latin>Iam in facie vultuque nostro, cum sint decem aut paulo plura membra, nullas duas in tot millibus hominum indiscertas effigies existere, quod Ars nulla in paucis numero praestet affectando;</latin> to which among other things, he thus prefaces, <latin>Naturae vero rerum vis atque majestas in omnibus momentis fide caret.</latin>

Though this at first may seem to be a Matter of small Moment, yet, if duly considered, will appear to be of mighty Importance in Humane Affairs: For should there be an undiscernible Similitude between divers Men, what Confusion and Disturbance would necessarily follow? What Uncertainty in all Sales and Conveyances, in all Bargains and Contracts? What Frauds and Cheats, and suborning of Witnesses? What a Subversion of Trade and Commerce? What Hazard in all Judicial Proceedings? In all Assaults and Batteries, in all Murders and Assassinations, in Thefts and Robberies, what Security would there be to Malefactors? Who could swear that such and such were the Persons that committed the Facts, though they saw them never so clearly? Many other Inconveniencies might be instanced in: So that we see this is no contemptible Argument of the Wisdom and Goodness of God.

*246

Judicial Proceedings? In all Assaults and Batteries, in all Murders and Assassinations, in Thefts and Robberies, what Security would there be to Malefactors? Who could swear that such and such were the Persons that committed the Facts, though they saw them never so clearly? Many other Inconveniencies might be instanced in: So that we see this is no contemptible Argument of the Wisdom and Goodness of God.

<1717>

Neither is the Difference of Voices less considerable for the distinguishing of Sexes and particular Persons, and Individuals of all Animals, than that of Faces; as Dr. Cockburn makes out, Essay, etc. Part II. Pag.68. etc. Nay, in some cases more; for hereby Persons in the dark, and those that are blind, may know and distinguish one another, which is of great Importance to them; for otherwise they might be most grossly cheated and abused.

Farther we may add out of the same Author, p. 71 “And to no other Cause than the Wise Providence of God can be referred the no less strange Diversity of Handwritings. Common Experience shews, that though Hundreds and Thousands were taught by one Master, and
one and the same Form of Writing, yet they should all write differently: Whether Men write Court or Roman Hand, or any other; there is some thing peculiar in every one's Writing, which distinguisheth it. Some, indeed, can counterfeit another's Character and Subscription;

*247

but the Instances are rare; nor is it done without Pains and Trouble: Nay, the most expert and skilful cannot write much so exactly like, as that it cannot be known, whether it be Genuine or Counterfeit. And if the Providence of God did not so order it, what Cheats and Forgeries too would daily be committed, which would not only justle private Men out of their Rights, but also unhinge States and Governments, and turn all into Confusion? The Diversity of Handwritings is of mighty great Use to the Peace of the World; it prevents Fraud, and secures Mens Property; it obligeth the Living and Present to Honesty and Faithfulness; it importeth the Mind of the Absent, and sheweth the Will of the Dead, which ought to be sacredly observed. And what is so very Useful, is not the Effect of any humane Concert. Men did not of themselves agree to it, they are only carried to it by the secret Providence of God, who understandeth and mindeth what is for the Good and Interest of Mankind in general, and of every particular Person.

Add farther to all this, That whereas there are Several Parts peculiar to Brutes, which are wanting in Man; as for Example, the seventh or suspensory Muscle of the Eye, the nictating Membrane, the strong Aponeuroses on the sides of the Neck, called by some Packwax, it is very remarkable, that these Parts are of eminent and constant Use to them, as I shall particularly shew hereafter, but to Man would have been altogether useless and superfluous. <1691> I have done with my general Observations. I proceed now more accurately and minutely to consider some particular Parts or Members of the Body; and First, the Head, because it was to contain a large Brain made of the most capacious Figure, as near as could be to a Spherical; upon this grows the Hair; which, though it be esteemed an Excrement, is of great Use (as I shewed before) to cherish and keep warm the Brain, and to quench the Force of any Stroke that might otherwise endanger the Skull. It serves also to disburden the Brain of a great deal of superfluous Moisture wherewith it abounds. <1691> and for a graceful ornament to the Face.

<1691>

I find it remark'd by Marchetti, a famous Anatomist in Padua, that the Cause of Baldness in Men is the Dryness of the Brain, and its shrinking from the Cranium or Skull; he having observ'd, that in bald Persons, under the bald part, there was always a Vacuity or empty Space between the Skull and the Brain. And, Lastly, to name no more, it serves also for a graceful Ornament to the Face, which our present Age is sensible enough of, bestowing so much Money upon false Hair and Periwigs. <1691>

<1717>

I find it remark'd by Marchetti, a famous Anatomist in Padua, that the Cause of Baldness in Men is the Dryness of the Brain, and its shrinking from the Cranium or Skull; he having observ'd, that in bald Persons, under the bald part, there was always a Vacuity or empty Space between the Skull and the Brain. And, Lastly, to name no more, it serves also for a graceful Ornament to the Face, which our present Age is sensible enough of, bestowing so much Money upon false Hair and Periwigs. <1691>

Secondly, Another Member which I shall more particularly treat of; is the Eye, a Part so artificially composed, and commodiously situate as nothing can be contrived better for Use, Ornament or Security, nothing to Advantage added thereto, or altered therein. Of the Beauty of the Eye I shall say little, leaving that to Poets and Orators; that it is a very
pleasant and lovely Object to behold, if we consider the Figure, Colours and Splendor of it, is the least that I can say. The Soul, as it is more immediately and strongly moved and affected by this Part than any other, so doth it manifest all its Passions and Perturbations by this.

As the Eyes are the Windows to let in the Species of all Exterior Objects into the dark Cells of the Brain, for the Informlation of the soul; so are they flaming Torches to reveal to those Abroad, how the soul within is moved or affected. These Representations made by the Impressions of External Objects upon the Eye, are the most clear, lively and distinct of any others. Now to this Use and Purpose of informing us what is Abroad round about us in this aspectable World, we shall find this Structure and Mechanism of the Eye, and every Part thereof; so well fitted and adapted, as not the least Curiosity can be added:

For, first of all, the Humours and Tunicles are purely transparent, to let in the Light and Colours unfolded and unsophisticated by any inward Tincture. It is usually said by the Peripateticks, that the Crystalline Humour of the Eye (which they ineptly fancied to be the immediate Organ of Vision, wherein all the Species of External Objects were terminated) is without all Colour, because its Office was to discern all Colours, or at least, to receive the Species of several Colours, and convey them to the common Sense. Now if itself had been coloured, it would have transmitted all visible Objects tinctured with the same Colour; as we see whatever is beheld through a coloured Glass, appears of the Same Colour with the Glass; and to those that have the Jaundice, or the like Suffusion of Eyes, Objects appear of that same Colour wherewith their Eyes are infected. This they say, is in a great Measure true, although they are much mistaken about the Organ and Manner of Vision, and the Uses of the Humours and Membranes of the Eye.

Two Reasons therefore may be assigned, why all the Membranes and Humours of the Eye are perfectly pellucid, and void of Colour. First, for the Cleanness. Secondly, For the Distinctness of Vision.

I. The Cleanness; for had the Tunicles and Humours of the Eye, all, or any of them been colorate, many of the Rays proceeding from the visible Object, would have been stoppt and suffocated before they could come to the bottom of the Eye, where the formal Organ of Vision is situate; for it is a most certain Rule, how much any Body hath of Colour, so much hath it of Opacity, and by so much the more unfit it is to transmit the Species.

Secondly, For the Distinctness of Vision; for, as I said before, and the Peripateticks observe well, were the Humours of the Eye tinctured with any Colour, they would refund that Colour upon the Object, and so it would not be represented to the soul, as in itself it is. So we see, that through a coloured Glass things appear as well more dim and obscure, as tinctured with the Colour thereof.

Secondly, The Parts of the Eye are made convex, and especially the Crystalline Humour, which is of a lenticular Figure, convex on both sides; that, by the Refractions there made, there might be a Direction of many Rays coming from one Point in the Object viz. as many as the Pupil can receive, to one Point Answerable in the Bottom of the Eye, without which the Sense would be very obscure, and also confused.
There would be as much Difference in the Clearness and Distinction of Vision, were the outward Surface of the Tunica Cornea plain, and the Crystalline Humour removed; as between the Picture received on a white Paper in a dark Room through an open or empty Hole, and the same received through a Hole furnished with an exactly polished lenticular Crystal; which, how great it is, any one, that hath but seen this Experiment made, knows well enough. Indeed, this Experiment doth very much explain the Manner of Vision; the Hole answering to the Pupil of the Eye, the Crystalline Humour to the lenticular Glass, the dark Room to the Cavity, containing the vitreous Humour, and the white Paper to the Tunica Retina.

Thirdly, The Uveous Coat, or Iris of the Eye, hath a musculous Power, and can dilate and contract that round Hole in it, called the Pupil, or Sight of the Eye. It contracts it for the excluding superfluous Light, and preserving the Eye from being injured by too vehement and lucid an Object, and again dilate it for the apprehending Objects more remote, or placed in a fainter Light; <latin> <*252*> tam mira artificio (saith Scheiner) quam munifica naturae largitate.</latin>

If any one desires to make Experiment of these Particulars, he may, following Scheiner and Des Cartes their directions, take a Child, and setting a Candle before him, bid him look upon it, and he shall observe his Pupil contract itself very much, to exclude the Light, with the Brightness whereof it would otherwise be dazzled and offended; as we are, when after we have been some time in the dark, a bright Light is suddenly brought in and set before us, till the Pupils of our Eyes have gradually contracted themselves: Let the Candle be withdrawn, or removed aside, he shall observe the Child's Pupil by Degrees to dilate itself. Or let him take a Bead, or the like Object, and holding it near the Eye, command the Child to look at it, the Pupil will contract much when the Object is near; but let it be withdrawn to a greater Distance in the same light, and he shall observe the Pupil to be much enlarged.

Fourthly, The Uveous Coat, and also the Inside of the Choroides, are blacken'd like the Walls of a Tennis-Court, that the Rays may be there suffocated and suppressed, and not reflected backwards to confound the Sight: And it' any be, by the Retiform Coat, reflected, they are soon choaked in the black Inside of the Uvea. Whereas were they reflected to and fro, there could be no distinct Vision: As we see the Light admitted into the dark Room we even now spake of obliterates the Species which before were seen upon the white Cloath or Paper.

<**175**> Fifthly, because the Rays from a nearer, and from a more remote Object, do not meet just in the same Distance behind the Crystalline Humour (as may easily be observed in Lenticular Glass, where the Point or Concourse of the Rays from a nearer Object is at a greater Distance behind the Glass, and from a farther at a lesser) therefore the Ciliary Processes, or rather the Ligaments observed in the Inside of the Sclerotick Tunicles of the Eye, by a late ingenious Anatomist, do serve instead of a Muscle, by their Contraction to alter the Figure of the Eye, and make it broader; and consequently draw the Retina nearer to the Crystalline Humour; and by their Relaxation suffer it to return to its natural Distance, according to the Exigency of the Object, in respect of Distance or Propinquity: And besides, possibly the Ciliary Proceisses may, by their Constriction or Relaxation, render the
Crystalline itself more gibbose or plain; and with the Help of the Muscles, a little alter the Figure of the whole Eye for the same Reason.

To what I have said might be added that the retiform

*254
Tunicle is whitish, for the better and more true Reception of the Species of Things. That there being a Distance necessarily required for the Collection of the Rays receiv'd by the Pupil, viz. those that proceed from one Point <**176> of the Object to one Point again in the Bottom of the Eye, the Retina must needs be set at a Distance from the Crystalline Humour: And therefore, Nature hath provided a large Room, and filled it with the pellucid vitreous Humour most fit for that Purpose.

I must not omit a notable Observation concerning the Place of the Insertion of the Optick Nerve into the Bulb of the Eye, and the Reason of it; which I owe to that learned Mathematician Peter Herigon; <latin>Nervus Opticus (saith lie in his Optica) ad latus ponitur, ne pars imaginis in eius foramen incidens pictura careat</latin>. The Optick Nerve is not situate directly behind the Eye, but on one side, lest that Part of the Image that falls upon the Hole of the Optick Nerve, should want its Picture. This I do not conceive to be the true Reason of this Situation; for even now as it is situate, that Part of the Object, whose Rays fall upon the Center or Hole of the Optick Nerve, wants its Picture, as we find by Experiences that Part not being seen by us, though we heed it not: But the Reason is, because if the Optick Axis should fall upon this Center (as it would do, were the Nerve seated just behind the Eye) this great Inconvenience would follow, that the middle Point of every Object <**177> we viewed would be invisible,

*255
or there would a dark Spot appear in the midst of it. Thus we see the admirable Wisdom of Nature in thus placing the Optick Nerve in respect of the Eye; which he that did not consider or understand, would be apt to think more inconveniently situate for Vision than if it had been right behind.

Another Thing also concerning Vision is most remarkable, that though there be a Decussation of the Rays in the Pupil of the Eye, and so the Image of the Object in the Retina, or Bottom of the Eye, be inverted, yet doth not the Object appear inverted, but in its right or natural Posture. The Reason whereof is, because the Visual Rays coming in straight Lines, by those Points of the Sensory or Retina which they touch, affect the common Sense or Soul, according to their Direction. That is, signifie to it, that those several Parts of the Object from whence they proceed, lie in straight Lines, (Point for Point) drawn through the Pupil to the several Points of the Sensory where they terminate, and which they press upon. whereupon the Soul must needs conceive the Object, not an inverted, but a right Posture; and that the Nerves are naturally made, not only to inform the soul of External Objects which press upon them, but also of <**178> the Situation of such Objects, is clear, because if the Eyes be distorted, the Object, will we, nill we, will appear double: so if the fore and middle Fingers be cross'd, and a round Body put between them, and moved, it will seem to

*256
be two; the Reason is, because in that Posture of the Fingers the Body touches the Outsides of them, which in their natural Sight are distant one from another, and their Nerves made to signifie to the soul Bodies separate and distant in like manner, two Fingers lying between them. And tho' our Reason, by the Help of our Sight, corrects this Error, yet cannot we but fancy it to be so.
Neither is the aqueous Humour, as some may supinely imagine, altogether useless or
unprofitable as to Vision, because by its Help the Uvea Tunica is sustained, which else
would fall flat upon the Crystalline Humour; and fluid it must be to give way to the
Contraction and Dilatation of the Uveous: And because the outermost Coat of the Eye might
chance to be wouncled or pricked, and this Humour being fluid let out, therefore Nature hath
made Provision speedily to repair it again in such a Case, <1717> by the help of certain
Water-pipes, or Lymphae-ducts inserted into the Bulb of the Eye, proceeding from
Glandules design'd by Nature to separate this Water from the Blood for that use. Antonius
Nuck affirms, that if the Eye of an Animal be prick'd, and the aqueous Humour squee'z'd out,
in ten Hours Space the said Humour and Sight shall be restored to the Eye, if at least the
Creature be kept in a dark Place. And that he did publickly demonstrate the same in the
Anatomical Theatre at Leyden, in a Dog, out of whose Eye being wounded the aqueous
Humour did

*257
so copiously flow, that the Membranes appeared flacid, and yet in six Hours Space the Bulb
of the Eye was again replete with its Humour, and that without the Application of any
Medicines. Antonius Nuck de Ductu novo salivali, etc.</1717>

Moreover, it is remarkable, that the Cornea Tunica [ horns or pellucid Coat of the Eye ] doth
not lie in the same superficies <**179> with the white of the Eye, but riseth up, as it were a
Hillock above its Convexity, and is of an Hyperbolical or Parabolical Figure: so that though
the Eye seems to be perfectly round, in Reality it is not so, but the Iris thereof is protuberant
above the White; and the Reason is, because that if the Cornea tunica, or Crystalline
Humour, had been concentrical to the Sclerodes, the Eye could not have admitted a whole
Hemisphere at one View, <latin>et sic Animalis incolumitati in multis rebus minus cautum
eset</latin>, as Scheiner well observes. In many Things there had not been sufficient
Caution or Care taken for the Animal's Safety.

And now (that I may use the Words of a late Author of our own <margin> Dr More,
Antidote against Atheism</margin> the Eye is already so perfect, that I believe the Reason
of a Man would easilly have rested here, and admired at his own Contrivance. For he being
able to move his whole Body upward and downward, and on every Side, might have
unawares thought himself sufficiently well provided for; but Nature hath added Muscles also
to the Eyes, that no

*258
Perfection might be wanting: For we have often occasion to move our Eyes, our Head being
unmoved, as in reading and viewing more particularly an Object set before us, by
transferring the Axes of our Eyes all <**180> over it: And that this may be done with the
more ease and Accuracy, she hath furnished this Organ with no less than six Muscles, to
move it upward, downward, to the Right and Left, obliquely and round about.

I shall now consider what Provision is made for the Defence and Security of this most
excellent and useful Part.

First, the Eyes are sunk in a convenient Valley, latent utiliter, and are encompassed round
with eminent Parts, as with a Rampart <latin> et excelsis undique partibus sepiuntur,
</latin> <margin>De Natur. Rerum l.2 Cicero </margin> so are defended from the strokes
of any flat or broad Bodies. Above stand the Eye-Brows, to keep of any thing from running
down upon them, as Drops of Sweat from the Forehead, or Dust, or the like.
Superiora superciliis obducta sudorem &agrave; capite et fronte defluentum repellunt. Cicero. Then follow the Eye-lids, which fence them from any sudden and lesser Stripes. These also round the Edges are fortified with stiff Bristles, as it were Pallisadoes, against the Incursions of importunate Animals, serving partly as a Fan to Strike away Flies or Gnats, or any other troublesome Insect; and partly to keep off

*259 Superfluous Light. <latin>Munit eq; sunt palpebrae tanquam vallo siquid incideret repelleretur. <**181> Idem ibid.

And because it was necessary that Man and other Animals should sleep, which could not be so well done if the Light came in by the Windows of the Eyes, therefore hath Nature provided these Curtains to be then drawn to keep it out.

And because the outward Coat of the Eye ought to be pellucid to transmit the Light, which if the Eyes should always stand open, would be apt to grow dry and shrink, and lose their Diaphaneity, therefore are the Eyelids so contrived, as often to wink, that so they may as it were glaze and varnish them over with the Moisture they contain, there being Glandules on purpose to separate a Humour for that Use, and withal wipe off whatever Dust or Filth may stick to them: And this, lest they should hinder the Sight, they do with the greatest Celerity. Cicero hath taken Notice, that they are made very soft, lest they should hurt the Sight.

Secondly, If we consider the Bulb or Ball of the Eye, the exterior Membrane or Coat thereof is made thick, tough and strong, that it is a very hard Matter to make a Rupture in it, and besides so slippery, that it eludes the Force of any Stroke, to which also its globular Figur e gives it a very great Advantage. <**182>

Lastly, because for the Guidance and Direction of the Body in Walking, and any Exercise, it is necessary the Eye should be uncovered, and exposed to the Air at all times and in all Weathers, therefore the most wise Author of Nature hath provided for it a hot Bed of Fat, which fills up the Interstices of the Muscles; and besides made it more patient and less sensible of Cold, than our other Parts and tho’ I cannot say with Cicero, absolutely free from Danger or Harm by that Enemy, yet least obnoxious to the Injuries thereof of any Part, and not at all, unless it be immoderate and extreme.

To all this I might add the Convenience of the Situation of the Eye in respect of its Proximity to the Brain, the Seat of Apprehension and Common Sense: Whereas had it been further removed, the Optick Nerves had been liable to many more Dangers and Inconveniencies than now they are.

Seeing then the Eye is composed of so great Variety of Parts, all conspiring to the Use of Vision, whereof some are absolutely necessary others very useful and convenient, none idle or superfluous; and which is remarkable, many of them of a different Figure and Consistency from any others in the Body besides, as being transparent, which it was absolutely necessary they should be, to transmit <**183> the Rays of

*261
Light: Who can but believe that this Organ was designed and made Purposely for the Use for which it serves?

Neither is it to be esteemed any Defect or Imperfection in the Eyes of Man, that they want the seventh Muscle, or the nictating Membrane, which the Eyes of many other Animals are furnished withal; for though they be very useful, and in a manner necessary to them, considering their manner of living, yet they are not so to Man. To such Beasts as feed upon Grass and other Herbs, and therefore are forced to hold their Eyes long in a hanging Posture, and to look downwards for the choosing and gathering of their Food, the Seventh or Suspensory Muscle is very useful, to enable them to do so without much Pain or Weariness; yet to Man, who doth not, nor hath any Occasion, indeed cannot hold his Head, or look long downwards, it would be useless and superfluous.

As for the nictating Membrane, or Periophthalmium, which all Birds, and I think most Quadrupeds, are furnished with, I have been long in doubt what the Use of it might be; and have sometimes thought it was for the more abundant Defence and Security of the Eye; but then I was puzzled to give any tolerable Account, why Nature should be more solicitous for the Preservation of the Eyes of Brutes than Men, and in this respect also to be a Step-Mother to the most noble Creature.

But the honourable Author Boyle, Of Final Causes, ch. 2, p. 53,54 formerly mention'd, gives a probable Account why Frogs anal Birds are furnished with such a Membrane. Frogs, because being Amphibious Animals, designed to pass their Lives in watery places, which for the most part abound with Sedges, and other Plants endowed with sharp Edges or Points; and the progressive Motion of this Animal being to be made not by Walking, but by Leaping, if his Eyes were not provided of such a Sheath, he must either Shut them, and so leap blindly, and by consequence dangerously, or by leaving them open run a Venture to have the Cornea cut, prick'd, or otherwise offended by the Edges or Points of the Plants, or what may fall from them upon the Animal's Eye: Whereas this Membrane (being something transparent as well as Strong) is like a kind of Spectacle that covers the Eye without taking away the Sight. Birds are likewise furnished with it because being destinatated to fly among the Branches of Trees and Bushes, their Prickles, Twigs, Leaves, or other Parts, would be apt otherwise to wound or offend their Eyes.

But yet still we are to seek why it is given to other Quadrupeds, whose Eyes are in no such Danger.

Thirdly, The Ear, another Organ of Sense, how admirable it is contrived for the receiving and conveying of sounds? First, There is the outward Ear or Auricula, made hollow and contracted by Degrees to draw the sound inward, to take in as much as may be of it, as we use a funnel to pour Liquor into any Vessel. And therefore if the Auricula be cut clear off, the Hearing is much impaired, and almost quite marred, as hath been by Experience found.

From the Auricula is extended a small, long, round Hole, inward into the Head, to intend the Motion, and so augment the force of the Sound, as we see in a shooting Trunk, the longer it is to a certain Limit, the swifter and more forcibly the Air passes in it, and drives the Pellet. At the End of this Hole is a Membrane, fastned to a round bony Limb, and stretched like the Head of a Drum, and therefore by Anatomists called also Tympanum, to receive the Impulse of the sound, and to Vibrate or quaver according to its reciprocal Motions or Vibrations; the
small Ear-bones being at the End fastned to the Tympanum, and furnished with a Muscle, serve for the Tension of that Membrane, or the Relaxation of it according to the Exigency of the Animal, it being Stretch'd to the utmost when it would hearken diligently to a lower or more distant sound.

Behind the Drum are several Vaults and Anfractuose Cavities in the Ear-Bone, filled only with what Naturalists call the Implanted Air; so to intend the least sound imaginable, that the Sense might be affected with it, as we see in subterraneous Caves and Vaults, how the sound is redoubled, and what a great Report it makes, however moderate it be: And because it was for the Behoof of the Animal, that upon any sudden Accident it might be awakened out of its sleep, therefore were there no Shuts or Stopples made for the Ears, that so any loud or sharp Noise might awaken it, as also a soft and gentle Voice or Murmur provoke it to sleep.

Now the Ears, for the Benefit and Conveniencies of the Animal, being always to stand open, because there was some Danger that Insects might creep in thereat and eating their way through the Tympanum harbour in the Cavities behind it; therefore hath Nature  loricated or plaistred over the sides of the forementioned Hole with Ear-wax, to stop and entangle any Insect that should attempt to creep in there. But I must confess myself not sufficiently to understand the Nature of sounds to give a full and satisfactory Account of the Structure and Uses of all the Parts of the Ear. They have a mind to le--h into the Ctiious Anatoll ;nd Use of this Part, may consult Monsieur da Verx y.

****

Fourthly, The next Part I shall take notice of shall be the Teeth; concerning which I find Seven Observations in the honourable Mr. Boyle's Treatise of Final Causes, which I shall briefly recapitulate, and add one or two more.

1. That the Teeth alone, among the Bones continue to grow in Length during a Man's whole Life, as appears by the unsightly Length of one Tooth, when its Opposite happens to fall, or be pulled out; which was most providently design'd to repair the Waste that is daily made of them by the frequent Attrition in Mastication. Here, by the by, I might advise Men to be careful how they attempt to cure this Blemish, by filing or cutting off the Head of such an overgrown Tooth, lest that befall them which happened to a certain Nun in Padua, who, upon cutting of a Tooth in that manner, was presently convulsed, and fell into an Epilepsy, as Bartholine in his Anatomy reports.

II. That that Part of the Teeth which is extant above the Gums, is naked, and not invested with that sensible membrane called Periosteum, wherewith the other Bones are covered.

III. That the Teeth are of a closer and harder substance than the rest of the Bones, for the more easy Breaking and Comminution of the more solid Aliments, and that they might be more durable, and not so soon worn down by grinding the Food.

IV. That for the nourishing and cherishing these so necessary Bones, the All wise Author of Things has admirably contrived an unseen Cavity in each side of the Jaw-bone, in which greater Channel are lodged an Artery, a Vein, and a Nerve, which through lesser Cavities, as it were through Gutters, send their twigs to each particular Tooth.
V. Because Infants were for a considerable time to feed upon Milk, which needs no
Chewing, and lest Teeth should hurt the tender Nipples of the Nurse, Nature hath deferred
the production of them for many Months in a humane foetus, whereas those of divers other
Animals, which are reduced to seek betimes Food that needs Mastication, are born with
them.

VI. The different Figure and Shape of the Teeth is remarkable. That the Fore-Teeth should
be formed broad, and with a thin and sharp Edge, like Chizzels, to cut off and take away a
morsel from any solid Food, called therefore Incisores. The next one on each side, stronger,
and deeper rooted, and more pointed, called therefore Canini, in English Eye-
Teeth, to tear the more tough and resisting sort of Aliments. The rest called Jaw-Teeth or
Grinders, in Latin, Molares, are made flat and broad atop, and withal somewhat uneven and
rugged that by their Knobs and little Cavities they may the better retain, grind, and commix
the Aliments.

VII. because the Operations to be performed by the Teeth, oftentimes require a considerable
Firmness and Strength, partly in the Teeth themselves, partly in the Instruments which
move the lower Jaw, which alone is moveable, Nature hath provided this with Strong
Muscles,

VIII. The Situation of the Teeth is most convenient, viz. the Molares or Grinders behind,
nearest the Center of Motion, because there is a greater Strength or Force required to chew
the Meat, than to bite a Piece, and the Cutters before, that they may be ready to cut off a
Morsel from any solid Food, to be transmitted to the Grinders.

IX. It is remarkable, that the Jaw in Men, and such Animals as are furnished with Grinders,
hath an oblique or transverse Motion, which is necessary for Chewing and Comminution of
the Meat; which it is observed not to have in those Animals that want the Molares.

*266

Fifthly, The Tongue is no less admirable for the Contexture and manifold Uses of it. First, It
is the Organ of Tasting; for being of a spungey Substance, the small Particles of our Meat
and Drink being mingled with the Saliva, easily insinuate themselves into the Pores of it,
and so do either gratefully affect it, or harshly grate upon it, accordingly as they are figured
and moved; and hereby we discern what is convenient or inconvenient for our Nourishment. It helps us likewise in the Chewing and Swallowing of our meat: And, Lastly, it is the main Instrument of Speaking, a Quality so peculiar to Man, that no Beast could ever attain to it. And although Birds have been taught to form some Words, yet they have been but a few, and those learnt with great Difficulty; but what is the Chief, the Birds understand not the Meaning of them, nor use them as signs of Things, or their own Conceptions of them; though they may use them as Expressions of their Passions: As Parrots having been used to be fed at the Prolation of certain Words, may afterwards, when they are hungry, pronounce the same. For this Des Cartes makes his main Argument, to prove, that Brutes have no Cogitation, because the highest of them could never be brought to signify their Thoughts or Conceptions by any artificial Signs, either Words, or Gestures, (which, if they had any, they would, in all likelihood, be forward enough to do) whereas all Men, both Fools and Mutes, make use of Words or other Signs to express their Thoughts, about any Subjects that present themselves; which Signs also have no reference to any of their Passions. Whereas the Signs that Brute Animals may be taught to use, are no other than such as are the Motions of some of their Passions, Fear, Hope, Joy, etc. Hence some of the Jewish Rabbins did not so absurdly define a Man Animal loquens, a speaking Creature.

Having had occasion just now to mention the Saliva, or Spittle, I am put in mind of the eminent Use of this Humour, which is commonly taken for an Excrement, because a great Part of our Food is dry; therefore Nature hath provided several Glandules to separate this Juice from the Blood, and no less than four Channels to convey it into the Mouth, which are of late Invention, and called by Anatomists Ductus Salivales, through which the Saliva distilling continually, serves well to macerate and temper our Meat, and make it fit to be chewed and swallowed. If a copious Moisture did not, by these Conduit-Pipes, incessantly flow down into the Mouths of Horses and Kine, how were it possible they should for a long time to, ether grind and swallow such dry Meat as Hay and Straw? Moreover, it is useful not only in the Mouth, but in the Stomach too, to promote Concoction, as we have already noted.

Sixthly, To the Mouth succeeds the Windpipe, no less wonderful in its Conformation. For because continual Respiration is necessary for the Support of our Lives, it is made with annular Cartilages to keep it constantly open, and that the Sides of it may not flag and fall together. And lest when we swallow, our Meat or Drink should fall in there, and obstruct it, it hath a strong Shut or Valve, called Epiglottis, to cover it close, and stop it when we swallow: For the more convenient bending of our Necks, it is not made of one entire continual Cartilage, but of many annular ones join’d together by strong Membranes, which Membranes are muscular, compounded of straight and circular Fibres, for the more effectual Contraction of the Wind-Pipe in any strong or violent Expiration or Coughing. And lest the Asperity or Hardness of these Cartilages should hurt the Oesophagus, or Gullet, which is tender, and of a skinny Substance, or hinder the Swallowing of our Meat, therefore these annular Gristles are not made round, or entire Circles; but where the Gullet touches the Wind-Pipe, there to fill up the Circle, is only a soft Membrane, which may easily give Way to the Dilation of the Gullet. And to demonstrate that this was designedly done for this
End and Use, so soon as the Wind-Pipe enters the Lungs, its Cartilages are no longer deficient, but perfect Circles or Rings, because there was no necessity they should be so, but it was more convenient they should be entire. <**204>

Lastly, For the various Modulation of the Voice the Upper end of the Wind-Pipe is endowed with several Cartilages and Muscles, to contract or dilate it, as we would have our Voice Flat or Sharp; and, moreover, the whole is continually moistened with a glutinous Humour issuing out of the small Glandules that are upon its inner Coat, to fence it against the Sharp Air received in, or Breath forced out; yet is it of quick and tender Sense, that it may be easily provoked to cast out by Coughing, whatever may fall into it from without, or be discharged into it from within.

<1717>It is also very remarkable which Caspar Bartholine hath observed in the Gullet, that where it perforateth the Midriff; the carneous Fibres of that Muscular Part are inflected and arcuate, as it were a Spincter embracing and closing it fast, by a great Providence of Nature, lest, in the perpetual Motion of the said Midriff, the upper Orifice of the Stomach should gape, and cast out the Victuals as fast as it received it.</1717>

Seventhly, The Heart, which hath been always esteemed, and really is, one of the principal Parts of the Body, the <latin>primum vivens, et ultimum moriens</latin> <1717>the First that quickens and the Last that dies,</1717> by its incessant Motion *272 distributing the Blood, the Vehicle of Life, and with it the Vital Heat and Spirits, throughout the whole Body, whereby it doth continually irrigate, nourish, and keep hot and supple all the Members. Is it not admirable, that from this Fountain of Life and Heat, there should be Channels and Conduit-Pipes, to every, even the least and most remote, Part of the Body; just as if from one Water-house, there should be Pipes conveying the Water to every House in a Town, and to every Room in each House; <**205> or from one Fountain in a Garden, there should be little Channels or Dikies cut to every Bed, and every Plant growing therein, as we have seen more than once done beyond the Seas.

I confess, the Heart seems not to be designed to so noble an Use as is generally believed, that is, to be the Fountain or Conservatory of the vital Flame, and to inspire the Blood therewith; (for the Lungs serve rather for the Accension, or maintaining that Flame, the Blood receiving there from the Air those Particles which are one Part of the Pabulum or Fewel thereof, and so impregnated, running back to the Heart) but to serve as a Machine to receive the Blood from the Veins, and to force it out by the Arteries through the whole Body, as a Syringe doth any Liquor, though not by the same Artifice: And yet this is no ignoble Use, the Continuance of the Circulation of the Blood being indispensably necessary for the quickening and enlivening of all the Members of the Body, and supplying of Matter to the Brain, for the Preparation of the Animal Spirits,

*273 the Instruments of all Sense and Motion.

Now for this Use of receiving and pumping out of the Blood, the Heart is admirably contrived. For, First, being a Muscular Part, the Sides of it are compos'd of two Orders of <**206> Fibres, running circularly or spirally from Base to Tip, contrarily one to the other, and so being drawn or contracted contrary-ways, do violently constringe and straiten the Ventricles, and strongly force out the Blood, as we have formerly intimated.
Then the Vessels we call Arteries, which carry from the Heart to the several Parts, have Valves which open outwards like Trap-doors, and give the Blood a free Passage out of the Heart, but will not suffer it to return back again thither; and the Veins, which bring it back from the several Members to the Heart, have Valves or Trap-doors which open inwards, so as to give way unto the Blood to run into the Heart, but prevent it from running back again that way. Besides, the Arteries consist of a quadruple Coat, the Third of which is made up of Annular or Orbicular Carneous Fibres to a good Thickness, and is of a Muscular Nature, after every Pulse of the Heart, serving to contract the Vessel successively with incredible Celerity; so by a kind of peristaltick Motion, impelling the Blood onwards to the capillary Extremities, and through the Muscles, with great Force and Swiftness.

So the Pulse of the Arteries is not only caused by the Pulsation of the Heart, driving the Blood through them, in manner of a Wave or Flush,

*274

as Des Cartes <**207> and others, would have it; but by the Coats of the Arteries themselves, which the Experiments of a certain Lovain Physician <margin>Cartes Epist. Vol.1 Ep.77 & Seq. </margin> (the first whereof is Galen's) do, in my Opinion, make good against him.

First, saith he, “if you slit the Artery, and thrust into it a Pipe, so big as to fill the Cavity of it, and cast a strait Ligature upon that Part of the Artery containing the Pipe, and so bind it fast to the Pipe; notwithstanding, the Blood hath free Passage through the Pipe, yet will not the Artery beat below the Ligature; but do but take of the Ligature, it will commence again to beat immediately. But because one might be ready to reply to this Experiment, that the reason why when bound it did not beat, was, because the Current of the Blood being straitned by the Pipe, when beneath the Pipe it came to have more Liberty, was not sufficient to stretch the Coat of the Artery, and so cause a Pulse; but when the Ligature was taken of it might flow between the enclosed Tube, and the Coat of the Artery: Therefore he adds another, which clearly evinces, that this could not be the Reason, but that it is something flowing down the Coats of the Artery that causes the Pulse: That is, if you straiten the Artery never so much, provided the Sides of it do not quite meet, and stop all Passage <**208> of the Blood, the Vessel will, notwithstanding, continue still to beat below or beyond the Coarctation. so we see some Physicians, both Ancients, (as Galen)

*275

and Modern, were of Opinion, that the Pulse of the Arteries was owing to their Coats; though the first, that I know of, who observed the third Coat of an Artery to be a muscular Body, composed of annular Fibres, was Dr. Willis.

This Mention of the peristaltick Motion, puts me in mind of an ocular Demonstration of it, in the Gullet of Kine when they chew the Cud, which I have often beheld with Pleasure. For, after they have swallowed one Morsel, if you look stedfastly upon their Throat, you will soon see another ascend, and run pretty swiftly all along the Throat up to the Mouth, which it could not do, unless it were impelled by the successive Contraction, or peristaltick Motion of the Gullet, continually following it. And it is remarkable, that these ruminant Creatures have a Power by the imperium of their Wills, of directing this peristaltick Motion upwards or downwards.

I shall add no more concerning the Heart, but that it, and the Brain, do mutuas opera tradere, enable one another to work: For, First, the Brain cannot itself live, unless it receive
continual Supplies of Blood from the Heart, but less can it perform its Functions of preparing and distributing the Animal Spirits; nor the Heart pulse, unless it receives Spirits, or something else that descends from the Brain by the Nerves. For do but cut asunder the Nerves that go from the Brain to the Heart, the Motion thereof, in most perfect and hot Creatures,

*276 ceaseth immediately. which Part began this Round is the Question.

<1717>I find, in the Philosophical Transactions Numb. 280. some notable Observations of the famous Anatomist Mr. William Cowper concerning the Artifice of Nature, in regulating the Motion of the Blood in the Veins and Arteries to assist and promote it in the one, and moderate it in the other, which I shall give you in his own Words:

“As the Arteries, (saith he) are known to export the Blood, so the Veins to carry it back again to the Heart; but having already described their Extremities, we come now to the large Trunks of the Veins, and here, as in the Arteries, we find the common Practice of Nature, in disposing the Branches of Veins to discharge the refluent Blood into the next adjacent Trunk, and so on to the Heart. As the Arteries afford abundance of Instances of Checks given to the Velocity of the Current of Blood through several Parts, so the Veins supply us with as many Artifices, to assist its regular Return to the Heart, as well as favour those Contrivances in the Arteries.

The carotid, vertebral, and splenick Arteries, are not only variously contorted, but also here and there dilated to moderate the Motion of the Blood; so the Veins that correspond to those Arteries are also variously dilated. The Beginnings of the internal Jugulars have a bulbous Cavity, which are diverticula to the refluent Blood, in the Sinus’s of the dura Mater,

*277 lest it should descend too fast into the Jugulars. The like has been taken Notice of by Dr. Lower, in the Vertebral Sinus’s. The Splenick Vein has divers Cells opening into it, near its Extremities in Humane hodies; but in Quadrupeds, the Cells open into the Trunks of the Splenick Veins.

The Spermatick Veins do more than equal the Length of the Arteries of the Testes in Men; their various Divisions, and several Inosculations, and their Valves are admirably contrived to suspend the Weight of the Blood, in order to discharge it into the larger Trunks of the Veins; and were it not that the refluent Blood from the Testes, is a Pondus to the influent Blood from the Arteries, and still lessens its Current in the Testes, these Spermatick Veins, like those of other Parts, might have discharged the Blood into the next adjacent Trunk.

Who can avoid Surprize at the Art of Nature, in contriving the Veins, that bring Part of the refluent Blood from the lower Parts of the Body, when they consider the Necessity of placing the Humane Heart, as well as that of most quadrupeds, so far from the Center of the Body towards its upper Part. It is for that End necessity, that the large Trunks of the Veins and Arteries should not associate each other. For if all the Blood sent to the lower Parts, by the descending Trunk of the Aorta, should return to the Heart again by one single Trunk, ( as it is sent out from thence ) the

*278 Weight of so much Blood in the ascending Trunks of the vena Cava, would oppose all the Force the Heart could give it from the Arteries, and hinder its Ascent. For this Reason the
vena Azygos, or fine Pari, is contrived to convey the Blood sent to the Muscles of the Back and Thorax, into the descending Trunk of the vena Cava above the Heart. Hence it's evident, that more Blood comes into the Heart by the descending or upper Trunk of the vena Cava, than passes out by the ascending Trunk of the Aorta. Nor does the Quantity of Blood convey'd to the Heart by the superior Trunk of the Cava, seem, without some other Design in Nature besides transporting it thither, to free the inserior Trunk from its Weight. But perhaps it was necessary so much Blood should be ready there to join with the Chyle, for its better Mixture, before it reaches the right Auricle of the Heart. So far Mr. Cowper. </1717>

Eighthly, The next Part I shall treat of shall be the Hand, this <greek>organon</greek> organOn or superlative Instrument, which serves us for such a multitude of Uses, as it is not easy to enumerate; whereto, if we consider the Make and Structure of it, we shall find it wonderfully adapted. First, It is divided into four Fingers bending forward, and one opposite to them bending backwards, and of greater Strength than any of them singly, which we call the Thumb, to join with them severally, or united; whereby it is fitted to lay hold of Objects of any Size or Quantity.

The least Things, as any small single Seed, are taken up by the thumb and Fore-finger; those a little greater by the Thumb and two Fingers, which also we chiefly employ to manage the Needle in sowing, and the Pen in Writing: When we would take up a greater Quantity of any Thing, we make use of the Thumb, and <**210> all the Fingers. Sometimes we use one Finger only, as in pointing at any Thing, picking Things out of Holes, or long and narrow Vessels; sometimes all severally at one time, as in stopping the Strings when we play upon any musical Instruments.

Secondly, The Fingers are strengthened with several Bones, jointed together for Motion, and furnished with several Muscles and Tendons, like so many Pullies to bend them circularly forwards; which is most convenient for the firm holding, and griping of any Object: Which of how great, constant, and necessary Use it is in pulling or drawing, but especially in taking up, and retaining any sort of Tool or Instrument to work withal, in Husbandry, and all mechanick Arts, is so obvious to every Man's Observation, that I need not spend Time to instance in Particulars: Moreover, the several Fingers are furnished with several Muscles, to extend and open the Hand and to move to the Right and Left: And so this Division and Motion of the Fingers doth not hinder, but that the whole Hand may be employed, as if it were all of a Piece; as we see it is, either expanded, as in striking out,

*279

smoothing and folding up of Cloaths, and some mechanick Uses; or contracted, as in Fighting, Kneading of Dough, and the like.

It is also notable, <**211> and indeed wonderful, that the Tendons, bending the middle joint of the Fingers, should be perforated to give Passage to the Tendons of the Muscles which draw the uppermost joints, and all bound down close to the Bone with strong Fillets, lest they should start up, and hinder the Hand in its Work, standing like so many Bow-strings.

Thirdly, The Fingers ends are strengthened with Nails, as we fortify the Ends of our Staves or Forks with Iron-Hoops or Ferules; which Nails serve not only for Defence, but for Ornament and many Uses. The Skin upon our Fingers ends is thin, and of most exquisite
Sense, to help us judge of any Thing we handle. If now I should go about to reckon up the several Uses of this Instrument, Time should sooner fail me than Matter.

By the Help of this we do all our Works, we build ourselves Houses to dwell in; we make ourselves Garments to wear; we plow and sow our Grounds with Corn, dress and cultivate our Vineyards, Gardens, and Orchards, gather and lay up our Grain, and Fruits, we prepare and make ready our Victuals: Spinning, Weaving, Painting, Carving, Engraving, and that Divinely invented Art of Writing, whereby we transmit our own Thoughts to Posterity, and converse with, and participate the Observations and Inventions of them that are long ago Dead, all performed by this. This is the only Instrument for all Arts whatsoever; no Improvement to be made of any Experimental Knowledge without it. Hence (as Aristotle saith well) they do amiss that complain, that Man is worse dealt with by Nature than other Creatures; whereas, they have some Hair, some Shells, some Wool, some Feathers, some Scales, to defend themselves from the Injuries of the Weather: Man alone is born Naked, and without all Covering; whereas, they have natural Weapons to defend themselves, and offend their Enemies, some Horns, some Hoofs, some Teeth, some Talons, some Claws, some Spurs and Beaks; Man hath none of all these, but is weak, and feeble, and unarmed sent into the World.

Why, a Hand, with Reason to use it, supplies the Uses of all these, that's both a Horn, and a Hoof; and a Talon, and a Tusk, etc. because it enables us to use weapons of these, and other Fashions, as Swords, and Spears, and Guns. Besides, this Advantage a Man hath of them, that whereas they cannot at Pleasure change their Coverings, or lay aside their Weapons, or make use of others as Occasion serves, but must abide Winter and Summer, Night and Day, with the same Cloathing on their Backs, and sleep with their Weapons upon them; a Man can alter his Cloathing according to the Exigency of the Weather, go warm in Winter, and cool in Summer, cover up himself hot in the Night, and lay aside his Cloaths in the Day, and put on or off more or fewer, according as his Work and Exercise is: And can, as Occasion requires, make use of divers sorts of Weapons, and Choice of such at all Tums, as are most proper and convenient; whereby we are enabled to subdue and rule over all other Creatures; and use for our own Behoof those Qualities wherein they excel, as the Strength of the Ox, the Valour and Swiftness of the Horse, the Sagacity and Vigilancy of the Dog, and so make them as it were our own.

Had we wanted this Member in our Bodies, we must have lived the Life of Brutes without House or Shelter, but what the Woods and Rocks would have afforded; without Cloaths or Covering; without Corn, or Wine, or Oil, or any other Drink but Water; without the Warmth and Comfort, or other Uses of Fire, and so without any artificial bak’d, boil’d, or roast Meats; but must have scrambled with the wild Beasts for Crabs, and Nuts, and Acorns, and such other Things as the Earth puts forth of her own Accord. We had laid open and exposed to Injuries, and had been unable to resist or defend ourselves against almost the weakest Creature.

The remaining Parts I shall but briefly run over;
That the Back-bone should be divided into so many Vertebres for commodious bending, and not be one entire rigid Bone, which being of that Length would have been often in Danger of snapping in sunder:

<1717>That it should be made tapering in the Form of a Pillar, the lower

*283
Vertebres being the broadest and largest, and the Superior in order, lesser and lesser; for the greater Firmness and Stability of the Trunk of the Body: </1717>

That the several Vertebres should be so elegantly and artificially compacted and joined together, that they are as Strong and firm, as if they were but one Bone: That they should be all perforated in the Middle with a large Hole for the Spinal Marrow or Pith to pass along; and each Particular have a Hole on each Side to transmit the Nerves to the Muscles of the Body, to convey both Sense and Motion:

<1717>That by Reason of the formentioned close Connexion of the Vertebres, it should be so formed, as not to admit any great Flexure or Recess from a Right Line, any Angular, but only a moderate Circular Bending; lest the Spinal Pith should be compressed, and so the free Intercourse or Passage of the Spirits to and fro be stop'd.

One Observation relating to the Motion of the Bones in their Articulations, I shall here add, That is, the Care that is taken, and the Provision that is made, for the easy and expeditate Motion of them; their being to that Purpose a twofold Liquor prepared for the Inunction and Lubrification of their Heads or Ends, I. An Oily one, furnished by the Marrow: 2. A Mucilaginous, supplied by certain Glandules seated in the Articulations, both which together make up the most apt and proper Mixture for this Use and End that can be invented or thought upon. For not only both

*284
the Ingredients are of a lubricating Nature; but there is this Advantage gained from their Composition, that they do mutually improve one another: For the Mucilage adds to the Lubricity of the Oil, and the Oil preserves the Mucilage from Inspissation, and contracting the Consistency of a Gelly: Now this Inunction is useful, indeed necessary, for three Ends chiefly.

1. For the facilitating of Motion. For tho' the Ends of the Bones are very smooth, yet were they dry, they could not with that Readiness and ease, nay, not without great Difficulty, yield to and obey the Plucks and Attractions of the Motory Muscles; as we see Clocks and Jacks, though the Screws and Teeth of the Wheels and Nuts be never so smooth and polish'd, yet if they be not oil'd, will hardly move, tho' you clog them with never so much Weight; but if you apply but a little Oil, they presently whirl about very swiftly with the tenth Part of the Force.

2. For preserving the Ends of the Bones from an Incalculency, which, they being hard and solid Bodies, would necessarily contract from a swift and long continuing Motion; such as that, of Running, or Mowing, or Threshing, or Sawing, and the like, if they immediately touched and rubbed against one another with that Force they must needs do; especially in running, the whole Weight of the Body bearing

*285
upon the Joints of the Thighs and Knees: So we see in the Wheels of Wagons or Coaches, the Hollows of the Naves, by their swift Rotations on the Ends of the Axle-trees, produce a Heat, sometimes so intense, as to set them on fire, to prevent which, they stand in need to be frequently anointed or besmear'd with a Mixture of Grease and Tar, imitating the forementioned natural Composition of Oil and Mucilage. Nay, Bodies softer a great deal than Metals, contract a great Heat by Attrition; as is evident from those black circular Lines we see on Boxes, Dishes, and other turned Vessels of Wood, which are the Effects of Ignition, caused by the Pressure of an edged Stick upon the Vessel turned nimbly in the Lathe. And if there had not been a Provision in the Joints against such a preternatural Incalcescence upon their violent Motion, this would have made a slothful World, and confin'd us to Leisurely and deliberate Movements, when there were the most urgent and hasty Occasions to quicken us.

3. For the preventing of Attrition, and wearing down the Ends of the Bones by their Motion, and rubbing one against another, which is so violent and lasting sometimes, that it is a Wonder any Inunction should suffice, to secure their Heads from Wasting and Consumption. I have often seen the Tops of the Teeth which are of a harder Substance than the rest of the Bones worn off by Mastication, in Persons who have lost most of their Grinders, and been compelled constantly to make use of three or four only in chewing, so low, that at last the inward Marrow and Nerve lay bare, and they could no longer, for Pain, make use of them. So that had there not been this Provision made for the anointing the Bones, the curious Workmanship of Nature in adapting them so exactly one to another, as was most fit for the easy Performance of all those Motions to which they were destined, would not suffice for Use: But the stirring Part of Mankind would soon find themselves fitter for an Hospital, than for Action, and the Pursuit of Business.

These Observations I acknowledge myself to have borrowed of a late ingenious Writer of Osteology *286* Mr Clopton Havers* who thus concludes his Discourse upon this Subject. And here we cannot avoid the Notice of the visible Footsteps of an infinite Reason, which as they are deeply impressed upon the Universe, so more especially on the sensible Parts of it in those rational Contrivances which are found in Animals: And we can never sufficiently admire the Wisdom and Providence of our great Creator, who has given all Parts in these animated Beings, not only such a Structure as renders them fit for their necessary Motions, and designed Functions, but withal the Benefit and Advantage of whatever may preserve them, or facilitate their Action.

Moreover, the Artifice of Nature is wonderful in the Construction of the Bones that

*287*

are to support the Body, and to bear great Burdens, or to be employed in strong Exercises, they being made hollow, for Lightness and Stiffness. For, we have before noted, a Body that is hollow may be demonstrated to be more rigid and inflexible, than a solid one of the same Substance and Weight. so that here is Provision made for the Stiffness and Lightness of the Bones. But the Ribs, which are not to bear any great Weight, or to be strongly exercised, but only to fence the Breast, have no Cavity in them, and towards the fore Part or Breast are broad and thin, that so they might bend and give way without Danger of Fracture; when bent returning by their elastick Property to their Figure again. Yet is not the Hollow of the Bones altogether useless, but serves to contain the Marrow; which supplies an Oil for the Maintaining and Inunction of the Bones and Ligaments, and so facilitating their Motion in the Articulations; and particularly which we mentioned not before) of the Ligaments,
preserving them from Dryness and Rigidity, and keeping them supple and flexible, and ready to comply with all the Motions and Postures of that moveable Part to which they appertain: And lastly, to secure them from Disruption, which, as strong as they are, they would be in some Danger of, upon a great and sudden Stretch or Contortion, if they were dry, etc. See more to this Purpose in the Treatise fore-quoted, p. 183.

*288

That whereas the Breast is encompassed with Ribs, the Belly is left free; that it might give way to the Motion of the Midriff in Respiration; and to the necessary Reception of Meat and Drink; as also for the convenient Bending of the Body; and in Females, for that extraordinary Extension that is requisite in the Time of their Pregnancy. <**215>

<1717>That the Lungs should be made up of such innumerable Air-Pipes and Vesicles interwoven with Blood-Vessels in order to purify, ferment, or supply the sanguineous Mass with Nitro-Aerial Particles, which rush in by their Elastic Power upon the Muscular Extension of the Thorax, and so feed the Vital Flame and Spirits; for upon obstructing this Communication, all is presently extinct, no Circulation, no Motion, no Heat, nor any Sign of Life remains.</1717>

That the Stomach should be membranous and capable of Dilatation and Contraction, according to the Quantity of Meat contained in it, that it should be situate under the Liver which by its Heat might cherish it, and contribute to Concoction: That it should be endowed with an acid <1717>or mandulous</1717> Ferment or some corruptive Quality for so speedy a Dissolution of the Meat, and Preparation of Chyle that after Concoction it should have an Ability of contracting itself, and turning out the Meat. <1717>That the Guts should immediately receive it from the Phylorous, farther elaborate, prepare,

*289

and separate it, driving by their Peristaltick Motion the Chyle into the Lacteals, and the excrementitious Parts to the Podex, from whence there is no Regress, unless when the Valve of the Colon is torn and relax'd: But for the curious Structure of these Parts, see more in Kerkringius, Glisson, Willis, and Peyes. </1717>

That the Bladder should be made of a membranous Substance, and so extremely dilatable for receiving and containing the Urine, till Opportunity of emptying it; that it should have Shuts for the Ends of the Ureters so artificially contrived as to give the Urine free Entrance, but to stop all Passage backward, so that they will not transmit the Wind, though it be strongly blown and forced in.

That the Liver should continually separate the Choler from the Blood, and empty it into the Intestines, where there is good Use for its not only to provoke Dejection, but also to attenuate the Chyle, and render it so subtle and fluid, as to enter in at the Orifices of the Lacteous Veins. <**216>

<1717>That in the Kidneys there should be such innumerable little Siphons or Tubes conveying the Urinose Particles to the Pelvis and Ureters, first discover'd by Bellini, and illustrated by Malpighy; that indeed all the Glands of the Body should be Congeries of various sorts of Vessels cur'd, circumgyrated, and complicated together, whereby they give the Blood time to stop and separate through the Pores of the
Capillary Vessels into the Secretory ones, which afterwards all exonerate themselves into one common Ductus; as may be seen in the Works of Dr. Wharton, Graaf, Bartholine, Rudback, Bilsius, Malpighi, Nuck, and others. That the Glands should separate such Variety of Humours, all different in Colour, Taste, Smell, and other Qualities.</1717>

Finally, That all the Bones, and all the Muscles, and all the Vessels of the Body should be so admirably contrived, and adapted, and compacted together for their several Motions and Uses, and that most Geometrically, according to the strictest Rules of Mechanicks; that if in the whole Body you change the Figure, Situation and Conjunction but of one Part, if you diminish or increase the Bulk and Magnitude: In fine, if you endeavour any Innovation or Alteration, you marr and Spoil, instead of Mending. How can all these Things put together, but beget Wonder and Astonishment?

<1717>

In the Muscles alone there seems to be more Geometry, than in all the artificial Engines in the World; and therefore the different Motions of Animals, are a Subject fit only for the great Mathematicians to handle; amongst whom, Steno, Dr. Croon, and above all, Alphonso Borelli, have made their Essays tovards it.</1717>

That under one Skin there should be such infinite Variety of Parts, variously mingled, hard with soft, fluid with fix'd, solid with hollow, those in Rest with those in Motion;

*291

some with Cavities, as Mortesses to receive, others with Tenons to fit those Cavities; all these so pack'd and thrust so close together, that there is no unnecessary Vacuity in the whole Body, and yet so far from clashing or interfering one with another, or hindring each others Motions, that they do all friendly Conspire, all help and assist mutually one the other, all concur in one general End and Design, the Good and Preservation of the Whole, are certainly Arguments and Effects of Infinite Wisdom and Counsel; so <**217> that he must needs be worse than mad that can find in his Heart to imagine all these to be casual and fortuitous, or not provided and designed by a most Wise and Intelligent Cause.

<1717>

Every Part is cloath'd, join'd togethet, and corroborated by Membranes, which upon several Occasions (as Extravasations of Humours, Compressions or Obstructions of Vessels) are capable of a prodigious Extension, as we see in the Hydatides of the Female Testicles or Ovaries, in Hydropical Tumors of the Lymphaeducts, of the Serotum and Peritoneum, out of the last of which alone twenty and even forty Gallons of Water have been drawn by a Paracentesis, or Tapping, for which we have the undoubted Authority of Tulpius, Meekren, Pechlin, Blasius, and other Medical Writers. What vast Sacks and Bags are necessary to contain such a Collection of Water, which seems to issue from the Lymphaeducts, either delacerated or obstructed, and exonerating themselves

*292

into the Foldings, or between the Duplicatures of the Membranes?

Those Parts which one would think were of little Use in the Body, serving chiefly to fill up empty Spaces, as the Fat, if examined strictly, will be found very beneficial and serviceable to it. I. To cherish and keep it warm, by hindring the Evaporation of the hot Streams of Blood, as Cloaths keep us warm in Winter, by reflecting and doubling the Heat.
2. To nourish and maintain the Body for some Time when Food is wanting, serving as Fewel to preserve and continue the natural Heat of the Blood, which requires an oily or sulphureous Pabulum, as well as Fire. Hence, upon long Abstinence and Fasting, the Body grows lean. Hence also some Beasts, as the Marmotto, or Mus Alpinus, a Creature as big or bigger than a Rabbet, which abounds all Winter, doth (as Hildanus tells us) live upon its own Fat. For in the Autumn, when it shuts itself up in its Hole which it digs with its Feet like a Rabbet, making a Nest with Hay or Straw, to lodge itself warm) it is very fat; [Hildanus took out above a Pound and a half of Fat between the Skin and Muscles, and a Pound out of the Abdomen] but on the contrary in the Spring-time when it comes forth again, very lean, as the Hunters experience in those they then take.

3. The Internal Fat serves for the Defence and Security of the Vessels, that they might lie soft, and be safely convey'd in their Passage, wherefore it is especially gathered about them.

*293
Passage, wherefore it is especially gathered about them.

By what Pores, or Passages, or Vessels, the Fat is separated from the Blood when it is redundant, and again absorpt into it when it is deficient, is a Matter of curious Enquiry, and worthy to be industriously sought out by the most sagacious and dextrous Anatomists. The Vessels whereunto it is received, and wherein contained, are by the Microscope detected to be Bladders, and those doubtless perforated and pervious one into another; and though for their excessive Subtlety and Thinness they appear not in a lean Body, yet seem to have been primitively formed and provided by Nature to receive the Fat upon Occasion. Why the Fat is collected chiefly about some particular Parts and Vessels, and not others; as for Example, the Reins and the Caul, I easily consent with Galen and others, the Reason to be the cherishing and keeping warm of those Parts upon which such Vessels are spread; so the Caul serves for the warming the lower Belly, like an Apron or Piece of Woolen Cloth. Hence a certain Gladiator, whose Caul Galen cut out, was so liable to suffer from the Cold, that he was constrained to keep his Belly constantly covered with Wool. For the Intestines containing a great deal of Food, thereto undergo its last Concoction, and no Vessels of Blood penetrating it, and flowing through it to keep it warm, they had need be defended from the Injuries of the external Air, by outward Coverings. Why there should be such copious Fat gathered about the Reins to enclose them, is not so easy to discern: But surely there is a great and constant Heat required there for the Separation of the Urine from the Blood; the constant Separation and Excretion whereof, is necessary for the Preservation of Life. And we see, if the Blood be in any Degree chill'd, the Secretion of Urine is in a great Measure stop't, and the Serum cast upon the Glandules of the Mouth and Throat. And if the Blood be extraordinarily heated by Exercise, or other wise, it casts off its Serum plentifully by Sweat, which may be effected by the swift Motion of the Blood through the Glandules of the Skin, where its plentiful Streams being strengthen'd and constipated into a Liquor, force their way through those Emunctories, which at other times transmit only insensible Vapors.

Some such Effect may be wrought upon the Blood, by the Heat of the Kidneys. Certain it is, that the Humours, excreted by Sweat and Urine, are near a-kin, if not the same; and therefore it is worthy the Consideration, whether there might not be some Use made of Sweating in a Suppression of Urine. But I digress too far.

I shall only add to this Particular, That because the Design of Nature in collecting Fat in these Places, is for the forementioned Use; it hath, for the effecting thereof, fitted the
Vessels there with Pores or Passages proper for the Separation and Transmission of it.<1717>

*295
I should now proceed to treat of the Generation and Formation of the Foetus in the Womb, but that is a Subject too difficult for me to handle; the Body of Man and other Animals being formed in the dark Recesses of the Matrix, or as the Psalmist phrases it, Psalm CXXXIX. 14. “made in secret, and curiously wrought in the lowest Parts of the Earth.” This Work is so admirable and unaccountable, that neither the Atheists nor Mechanick Philosophers have attempted to declare the Manner and Process of it; but have (as I noted before) very cautiously and prudently broke off thes Systems of Natural Philosophy here, and left this Point untouch'd; and those Accounts which some of them have attempted to give of the Formation of a few of the Parts, are so excessively absurd and ridiculous, that they need no other Confutation than ha, ha, he.

And I have already farther shewn, that to me it seems impossible that Matter divided into as minute and subtle Parts as you will, or can imagine, and those moved according to what Catholick laws sover can be devised, <**218> should without the Presidency and Direction of some intelligent Agent, by the meer Agitation of a gentle Heat, run itself into such a curious Machine, as the Body of Man is.

Yet must it be confess'd, that the Seed of Animals is admirably qualified to be fashioned and formed by the Plastick Nature into an Organical Body, containing the Principles or component Particles of all the several homogeneous

*296
Parts thereof; for indeed every Part of the Body seems to club and contribute to the Seed, else why should parents that are born Blind or Deaf, or that want a Finger, or any other Part, or have one superfluous, sometimes generate Children that have the same Defects or Imperfections; and yet (which is wonderful) nothing of the Body or grosser Matter of the Seed comes near the first Principle of the Foetus, or in some so much as enters the Womb, but only some contagious Vapour, or subtle Effluviums thereof; <1717> which seems to animate the Gemma or Cicatricula of the Egg contain'd in the Female Ovary, before it passes through the Tubes, or Cornua, into the Uterus. How far the Animalcules observ'd in the Seed of Males, may contribute to Generation, I leave to the more sagacious Philosophers to enquire, and shall here content myself with referring the Reader to the several Letters publish'd by Mr. Lewenhoek.

But to what shall we attribute the Foetus its Likeness to the Parents, or omitting them to the precedent Progenitors, as I have observ'd some Parents that have been both black Hair'd to have generated most red Hair'd Children because their Ancestor's Hair hath been of that Colour; or why are Twins so <**220> often extremely alike? Whether is this owing to the Efficient, or to the Matter ?

Those Effluvia we spake of in the Male Seed, as subtle as they are, yet have they a great, if not the greatest Stroke in Generation, as is

*297
clearly demonstrable in a Mule, which doth more resemble the Male Parant, that is the Ass, than the Female or Horse. But now, why such different Species should not only mingle together, but also generate an Animal, and yet that that hybidous Production should not
again generate, and so a new Race be carried on, but Nature should stop here, and proceed no farther, is to me a Mystery, and unaccountable.

One thing relating to Generation I cannot omit; that is, the Construction of a Set of Temporary Parts, (like Scaffolds in a Building) to serve a present End, which are afterwards laid aside, afford a strong Argument of Counsel and Design. Now for the Use of the Young during its Enclosure in the Womb, there are several Parts formed, as the Membranes enveloping it, called the Secundines, the Umbilical Vessels, one Vein and two Arteries; the Urachus, to convey the Urine out of the Bladder, and the placenta uterina; Part whereof fall away at the Birth, as the Secundines and Placenta, others degenerate into Ligaments, as the Urachus, and <**220> part of the Umbilical Vein: besides which, because the Foetus during its Abode in the Womb, hath no Use of Respiration by the Lungs, the Blood doth not all, I may say not the greatest Part of it, flow through them; but there are two Passages or Channels contrived, one called the Foramen Ovale, by which Part of the Blood brought by the Vena Cava, passeth immediately into the

*298
Left Ventricle of the Heart, without entring the Right at all; the other is a large Arterial Chanel passing from the pulmonary Artery immediately into the Aorta, or great Artery which likewise derives Part of the Blood thither; without running at all into the Lungs: These two are closed up soon after the Child is born, when it breathes no more (as I may so say) by the Placenta Uterina, but Respiration by the Lungs is needful for it.

It is here to be noted, that though the Lungs be formed so soon as the other Parts, yet during the Abode of the Foetus in the Womb, they lie by as useless. In like manner I have observed, that in ruminating Creatures, the three foremost Stomachs, not only during the Continuance of the Young in the Womb, but so long as it is fed with Milk, are unemployed and useless, the Milk passing immediately into the fourth. <**221>

Another Observation I shall add concerning Generation, which is of some moment, because it takes away some Concessions of Naturalists that give countenance to the Atheists fictitious and ridiculous Account of the first production of Mankind, and other Animals, viz. that all sorts of Insects, yea, and some Quadrupeds too, as Frogs and Mice, are produced spontaneously. My Observation and Affirmation is, that there is no such thing in Nature, as AEquivocal or Spontaneous Generation, but that all Animals, as well small as great, not excluding the vilest and most contemptible insect, are generated

*299
by Animal Parents of the same Species with themselves; that Noble Italian Vertuoso, Francisco Redi, having experimented, that no putrified Flesh (which one would think were the most likely of any thing) will of itself, if all Insects be carefully kept from it, produce any: The same Experiment, I remember, Dr. Wilkins, late Bishop of Chester, told me, had been made by some of the Royal Society. No Instance against this Opinion doth so much puzzle me, as Worms bred in the Intestines of Man, and other Animals. But Seeing the round Worms do manifestly generate, and probably the other Kinds too, it's likely they come originally from Seed, which how it was <**222> brought into the Guts, may afterwards possibly be discovered.

Moreover, I am inclinable to believe, that all Plants too, that themselves produce Seed, which are all but some very imperfects ones, which scarce deserve the Name of Plants) come of Seeds themselves. For that great Naturalist Malpighius, to make Experiment whether Earth would of itself put forth Plants, took some purposely digged out of a deep
place, and put it into a Glass-Vessel, the Top whereof he covered with Silk many times
doubled, and strained over it, which would admit the Water and Air to pass through, but
exclude the least Seed that might be wafted by the Wind; the Event was that no Plant at all
sprang up in it; Nor need we wonder how in a Ditch, Bank, or Grass-Plat, newly dig'd, or in
the Fen-Banks in the Isle of Ely, Mustard

*300
should abundantly Spring up, where, in the Memory of Man, none hath been known to grow,
for it might come of Seed which had lain there more than a Man's Age. some of the Ancients
mentioning some Seeds that retain their Fecundity Forty Years.

<1717>
And I have found in a Paper received from a Friend, but whom I have forgotten, That
Melon-Seeds, after Thirty Years, are best for raising of Melons. As for the Mustard that
sprung up in the Isle of Ely, though there had never been any in that Country, yet might it
laeve been brought down in the Chanels by the Floods, and so being thrown up the Banks,
together with the Earth, might germinate and grow there.

And, indeed, a Spontaneous Generation of Animals and Plants, upon due Examination will
be found to be nothing less than a Creation of them. For after the Matter was made, and the
Sea and dry Land separated, how is the Creation of Plants and Animals described but by a
commanding, that is, effectually causing the Waters and Earth to produce their several
Kinds without any Seed ? Now Creation being the Work of Omnipotency, and
incommunicable to any Creature, it must be beyond the Power of Nature or natural Agents,
to produce things after that manner. And as for God Almighty, He is said to have rested
from His Work of Creation after the Seventh Day. But if there be any Spontaneous
Generation there was nothing done at the Creation, but what is daily done; for the Earth and
Water

*301
produc'd Animals then without Seed, and so they do still.

Because some, I understand, have been offended at my consident Denial of all Spontaneous
Generation, accounting it too bold and groundless, I shall a little enlarge upon it, and give
my Reasons, in order to their Satisfaction.

First, then, I say, such a Spontaneous Generation seems to me to be nothing less than a
Creation. For, Creation being not only a Production of a Thing out of Nothing, but also out
of indisposed Matter, as may be clearly insered from the Scripture, and is agreed by all
Divines; this Spontaneous Generation, being such a Production, wherein doth it differs from
Creation ? Or, what did God Almighty do at the first Creation of Animals and Plants, more
than what (if this be true) we see every day done ? To me, I must consess, it seems almost
demonstrable, that whatever Agent can introduce a Form into indisposed Matter, or dispose
the Matter in an instant, must be superior to any natural one, not to say Omnipotent.

Secondly, Those who have with the greatest Diligence and Application considered and
searched into this Matter, as those eminent Virtuosi, Marcellus Malpighius, Franciscus Redi,
John Swammerdam, Lewenhoek, and many others, are unanimously of this Opinion, save
that Franc. Redi would except such Insects as are bred in Galls, and some other
Excrescencies

*302
of Plants. Now their Authority weighs more with me, than the general Vogue, or the concurrent Suffrages of a thousand others who never examined the thing so carefully and circumspectly as they have done, but run away with the Cry of the common Herd of Philosophers.

First of all, Dr. Swammerdam, who hath been, to the best Purpose of any Man I know of, busied in searching out and observing the Nature of all Insects in general; all in general I say (for as to one particular Insect, to wit, the Silk-Worm, I must except Signior Malpighy; and to one genus of them, to wit, Spiders, Dr. Lister; in his general History of Insects, written in Low Dutch, and translated into French, p. 47. hath these Words, <french>Nous disons, qu’il ne fait dans toute la nature aucune generation par accident, &c.</french> We affirm, that there is not in all Nature any accidental [or Spontaneous] Generation, but all come by Propagation; wherein Chance hath not the least Part or Interest. And in p.159, speaking of the Generation of Insects out of Plants, in Contradiction I suppose to Signior Redi, he saith, <french>Nous croyons absolument, &c.</french> We do absolutely believe that it is not possible to prove by Experience, that any Insects are engendred out of Plants: But on the contrary, we are very well informed and assured, that these little Animals are not Shut up in or enclosed there for any other Reason than to draw thence their Nourishment. It's true indeed, that by a certain, constant, and

*303 immutable Order of Nature, we see many sorts of Insects affixed to particular Species of Plants and Fruits, to which the respective Kinds fasten themselves as it were by Instinct. But we are to know, that they all come of the Seed of Animalcules of their own Kind, that were before laid there. For these Insects do thrust their Seed or Eggs so deep into the Plants, that they come to be afterwards as it were united with them, and the Aperture or Orifice by which they entred, quite closed up, and obliterated; the Eggs being hatched and nourished within. We have often found the Eggs of Insects so deeply sunk into the tender Buds of Trees, that without hurting of them it was impossible to draw them out. Many Instances he produces in several sorts of Insects making their way into Plants, which, though they be well worth the reading, are too long to transcribe.

Secondly, That Great and Sagacious Naturalist, and most Accurate Examiner of these things, Signior Malpighy, in his Treatise of Galls, under which Name he comprehends all Preternatural and Morbose Tumors and Excrencies of Plants, doth demonstrate in particular, that all such Warts, Tumors, and Excrencies, where any Insects are found, are excited or raised up either by some Venenose Liquor, which together with their Eggs, such Insects shed upon the Leaves, or Buds, or Fruits of Plants, or boring with their Terebrae, instill into the very Pulp of such Buds or Fruits; or by the contagious Vapor of the very Eggs

*304 themselves producing a Mortification or Syderation in the Parts of Plants on which they are laid; or lastly, by the Grubs or Maggots hatch'd of the Eggs laid there, making their way with their Teeth into the Buds, Leaves, or Fruit, or even the Wood itself, of such Plants on which their Eggs were laid.

So at last he concludes, <latin>Erunt itaque Gallae et reliqui plantarum tumores morbosae excrecentiae, vi depositi ovi &agrave; turbata plantarum compage, et vitiato humorum motu excitatae, quibus inclusa ova et animalcula velut in utero foventur et augentur, donec manifestatis firmatisque propriis partibus, quasi exoriantur novam exoptantia auran.</latin>

We conclude therefore, that Galls, and other Tumors of Plants, are nothing else but Morbose Excrencies, raised up by the Force of the Eggs there laid, disturbing the Vegetation and
temper of the Plants, and perverting the Motion of their Humours and Juices; wherein the enclosed Eggs and Animalcules are cherished, nourished, and augmented, till their proper Parts being manifested, explicated, and hardned, or strengthned, they are as it were new-born, affecting to come forth into the open Air. In the same Treatise he describes the hollow Instrument, (Terebra he calls it, and we may English it Piercer) wherewith many Flies are provided, proceeding from the Womb, with which they perforate the Tegument of Leaves, Fruits, or Buds, and through the hollow of it inject their Eggs into the Holes or Wounds which they have made, where, in process of Time, they are hatch'd and nourished.

*305
This he beheld one of these Insects doing, with his own Eyes, in the Bud of an Oak; the manner whereof he describes, p. 47. which I shall not transcribe, only take Notice, that when he had taken off the Insects, he found in the Leaf very little and Diaphanous Eggs, exactly like to those which yet remained in the Tubes of the Fly's Womb. He adds farther, that it is probable, that there may be Eggs hidden in divers Parts of Plants, whereof no Footstep doth outwardly appear, but the Plant remains as entire, and thrives as well as if there were no Insect there: Nay, that some may be hidden and cherished in dry Places, (not wanting any Humour to feed them) as in Sear-Wood, yeas in Earthen-Vessels, and Marbles themselves.

Indeed to me it seems unreasonable, that Plants being of a lower Form or Order of Being, should produce Animals; for either they must do it out of indisposed Matter, and then such Production would amount to a Creation, or else they must prepare a fit Matter, which is to act beyond their Strength, there being required to the Preparation of the Sperm of Animals a great Apparatus of Vessels, and many Secretions, Concoctions, Reflexions, Digestions and Circulations of the Matter, before it can be rectified and exalted into so noble a Liquor: And Besides, there must be an Egg, too; for we know <latin>ex ovo omnia</latin>, to the Perfection whereof; there are as many Vessels, and as long a Process required. Now in Plants there are no such Vessels, and consequently no such

*306
Preparation of Eggs or Sperm, which are the necessary Principles of Animals.

Thirdly, that worthy Author of our own Country, I mean Dr. Lister, in his Notes Upon Geodartius Insect. Numb. 16. p. 47. hath these Words, <latin>Non enim inducor ut credam, hoc, vel aliud quodvis Animal, modo quodam spontaneo &egrave; Planta produci, et alii causa<euro>cinque originem suam Parenti Animali;</latin> i.e. I cannot be persuaded or induced to believe, that this or any other Animal is (or can be) produced out of a Plant in a spontaneous Manner, or doth owe its Original to any other Cause whatever, than an Animal Parent of its own Kind. And in his third Note upon Insect. Numb. 49. these, <latin>Quoad spontaneam Erucae hujus aliorumque Insectorum generationem pro parte negativa jam sententiam meam tradidi, &c.</latin> As to the Spontaneous Generation of this Eruca, and other Insects, I have already delivered my Opinion for the Negative. This is most certain, that these Cossi are produced of Eggs laid by Animal Parents. It is also alike clear, that these diminutive Caterpillars are able by Degrees to pierce or bore their way into a Tree which very small Holes, after they are fully entred, do perchance grow together, and quite disappear; at least become so small that they are not to be discerned, unless by Lynceus’s Eyes. Add moreover, that perchance they undergo no Transformation, but continue under the Vizzard of [Erucae] Caterpillars for many Years, which doth very well accord with my Observations. Moreover, that this Caterpillar [Eruca] is propagated

*307
by Animal Parents, to wit, Butterflies, after the common Origination of all Caterpillars. In all this I fully consent with the Doctor; only crave leave to differ in his attributing to them the Name of Cossi, which were accounted by the Ancients of a delicate Morsel, and fed for the Table; for I take those to have been the Hexapods, from which the greater sort of Beetles come; for that that sort of Hexapods are at this Day eaten in our American Plantations, as I am informed by my good Friend Dr. Hans Sloane, who also presented me with a Glass of them, preserved in Spirit of Wine.

Having lately had an Opportunity more curiously to view and examine the great flesh-colour’d, thin-hair’d English Caterpillar, which is so like that sent me by Dr. Sloane, that it differs little but in Magnitude, which may be owing to the Climate,) I observed that it had a Power of drawing its eight hind Legs or Stumps so far up in its Body, that they did altogether disappear, so that the Creature seemed to want them, and of thrusting them out again at Pleasure : Whereupon I conjectured, That that Insect of Jamaica sent me by the Dodor, which I took to be the Cossus or Hexapod, previous to some large Beetle) had likewise the same Power of drawing up its hind Legs; so that though to Appearance it wanted them yet really it did not so, but had only drawn them up, and hid them in its Body, when it was immersed in the Spirit of Wine, and consequently was not the Hexapod of a Beetle, but an

*308
Eruca, like to, or indeed specifically the same with that of our own Country by me observed; and being eaten at this Day by the Inhabitants of Jamaica, in all likelihood the same with the Cossus of the ancient Romans, which was fed for the Table, as Pliny assures us: Especially, if we consider, that Dr. Lister found this Eruca in the Body of an Oak newly cut down, and sawed in Pieces; on which Tree, Pliny saith, they feed. Thus much I thought fit to add to Dr. Lister, and do the Truth right, by retracting my former Conjecture concerning the Cossi.

3. My third Argument against Spontaneous Generation, is, because there are no Arguments or Experiments, which the Patrons of it do or can produce, which do clearly evince it. For the general and vulgar Opinion, that the Heads of Children, or the Bodies of those that do not change their Linen, but wear that which is sweaty and sordid, breeds Lice; or that Cheese of itself breeds Mites or Maggots, I deny, and look upon it as a great Error and Mistake; and do affirm, that all such Creatures are bred of Eggs laid in such sordid Places by some wandring Louse, or Mite, or Maggot. For such Places being most proper for the Hatching and Exclusion of their Eggs, and for the Maintenance of their Young, Nature hath endowed them with a wonderful Acuteness of Scent and Sagacity, whereby they can, though far distant, find out, and make towards them. And even Lice and Mites themselves, as now as

*309
they seem to be, can, to my knowledge, in no long time march a considerable way to find out a convenient Harbour for themselves.

Here, by the by, I cannot but look upon the Strange Instinct of this noisome and troublesome Creature the Louse, of searching out foul and nasty Cloaths to harbour and breed in, as an Effect of Divine Providence, designed to deter Men and Women from Slutishness and Sordidness, and to provoke them to Cleanliness and Neatness. God himself hateth Uncleanliness, and turns away from it, as appears by Deut. cap. xxiii. ver. 12, 13, 14. But if God requires, and is Pleased with bodily Cleanliness, much more is he so with the Pureness of the Mind. Blessed are the pure in Heart, for they shall see God, Matth. v. 10.
As for the Generation of Insects out of putrid Matter, the Experiments of Franciscus Redi, and some of our own Virtuosi, give me sufficient Reason to reject it. I did but just now mention the quick Scent that Insects have, and the great Sagacity in finding out a proper and convenient Harbour or Matrix, to cherish and hatch their Eggs, and feed their Young: They are so acted and directed by Nature, as to cast their Eggs in such Places as are most accommodate for the Exclusion of their Young, and where there is Food ready for them as soon as they be hatch'd: Nay, it is a very hard matter to keep off such Insects from shedding their Seed in such proper Places. Indeed, if an Insect may be thus equivocally generated, why not sometimes a Bird? a Quadruped, a Man, or even an Universe? Or, why no new Species of Animal now and then? As my learned Friend Dr. Tancred Robinson very well argues in his Letters: For there is as much Art shewn in the Formation of those, as of these.

A fourth and most effectual Argument against Spontaneous Generation, is, that there are no new Species produced, which would certainly now and then, nay, very often happen, were there any such thing. For in such pretended Generations, the Generant or Active Principle is supposed to be the Sun, which being an inanimate Body, cannot act otherwise than by his Heat; which Heat can only put the Particles of the passive Principle into Motion. The passive Principle is putrid Matter; the Particles whereof cannot be conceived to differ in any thing, but Figure, Magnitude, and Gravity. Now the Heat putting these Particles in Motion, may indeed gather together those which are homogeneous, or of the same Nature, and separate those that are heterogeneous, or of a different; but that it should so situate, place, and connect them, as we see in the Bodies of Animals, is altogether inconceivable; which, if it could, yet that it should always run them into such a Machine as is already extant, and not often into some new-fashioned one, such as was never seen before, no Reason can be assign’d or imagined. This the Epicurean Poet Lucretius was so sensible of, that he saw a Necessity of granting Seeds or Principles to determine the Species. For (saith he) if all sorts of Principles could be connected,

*311*

\[
<\text{latin}>Vulgo fieri portenta videres,
Semiferas hominum species existere, et altos
Interdum ramos egigni corpore vivo;
Multaque connecti terrestria membra marinis;
Tum flammam retro spirantes ore chimaeras
Pascere naturam per terras omniparenteis
Quorum nil fieri manifestum est, omnia quando
Seminibus certis, certa genetrice, creata
Conservare genus crescentia posse videmus, &c.<\text{latin}>
\]

That is, Thence would rise
Vast Monsters, Nature’s great Absurdities;
some thing half Beast, half Man, and some would grow
Tall Trees above, and Animals below;

Some join'd of Fish, and Beasts, and every where
Frightful Chimaera’s breathing Flames appear.
But since we see no such, and Things arise
From certain Seeds of certain Shape and Size,
And keep their Kind as they increase and grow;
There’s some fix’t Reason why it should be so.

The raining of Frogs and their Generation in the Clouds, though it be attested by many and great Authors, I look upon as utterly false and ridiculous. It seems to me no more likely, that Frogs should be engender’d in the Clouds, than Spanish Gennets begotten by the Wind; for that hath good Authors too. And he that can swallow the raining of Frogs hath

*312

made a fair Step towards believing, that it may rain Calves also; for we read, that one fell out of the Clouds in Avicen's Time. Nor do they much help the matter, who say, that those Frogs that appear sometimes in great Multitudes after a Shower, are not indeed engendred in the Clouds, but coagulated of a certain sort of Dust, commixt and fermented with Rain-water; to which Hypothesis Fromondus adheres.

But let us a little consider the Generation of Frogs in a natural Way.

1. There are two different Sexes, which must concur to their Generation. 2. There is in both a great Apparatus of Spermatick Vessels, wherein the nobler and more spirituous Part of the Blood, is by many Digestions, Concoctions, Reflexions, and Circulations, exalted into that generous Liquor we call Sperm; and likewise for the preparing of the Eggs. 3. There must be a Copulation of the Sexes, which I rather mention, because it is the most remarkable in this, that ever I observed in any Animal. For they continue in complexu Venereo, at least a Month indefinitely; the Male all that while resting on the Back of the Female, clipping and embracing ller wlth his Legs about the Neck and Body, and holding her so fast, that if you take him out of the Water, he will rather bear her whole Weight, than let her go. This I observed in a couple, kept on Purpose in a Vesel of Water, by my Learned and Worthy Friend Mr. John Nid, Fellow of Tribity College, long

*313

since deceased. After this, the Spawn must be cast into Water, where the Eggs lie in the midst of a copious Gelly, which serves them for their first Nourishment for a considerable while. And at last, the Result of all is not a perfect Frog, but a Tadpole without any Feet, and having a long Tail to swim withall; in which Form it continues a long time, till the Limbs be grown out, and the Tail fallen away, before it arrives at the Perfection of a Frog.

Now, if Frogs can be generated spontaneously in the Clouds out of Vapour, or upon the Earth out of Dust and Rain-Water, what needs all this a-do? To what purpose is there such an Apparatus of Vessels for the Elaboration of the Sperm and Eggs; such a tedious Process of Generation and Nutrition? This is but an idle Pomp. The Sun (for he is supposed to be the equivocal Generant or Efficient by these Philosophers) could have dispatch’d the Business in a trice: Give him but a little Vapour, or a little dry Duft and Rain-Water, he will produce you a quick Frog, nay, a whole Army of them, perfectly form’d, and fit for all the Functions of Life in three Minutes, nay, in the hundredth Part of one Minute, else must some of those Frogs that were generated in the Clouds fall down half-formed and imperfect, which I never heard they did; and the Process of Generation have been observed in the Product;on of Frogs out of Dust and Rain-Water, which no Man ever pretended to mark or discern. But that there can be no Frogs

*314

generated in the Clouds, may farther be made appear, 1. From the extreme Cold of the middle Region of the Air; where the Vapours are turned into Clouds, which is not at all propitious to Generation. For did not so great Men as Aristotle and Erasmus report it, I could hardly be induced to believe that there could be one Species of Insects generated in
Snow.

2. Because, if there were any Animals engender'd in the Clouds, they must needs be maimed and dashed in Pieces by the fall, at least such as fell in the High-ways, and upon the Roofs of Houses; whereas we read not of any such broken or imperfect Frogs found any where. This Last Argument was sufficient to drive off the Learned Fromondus from the Belief of their Generation in the Clouds; but the Matter of Fact he takes for granted, I mean the Spontaneous Generation of Frogs out of Dust and Rain-Water, from an Observation or Experiment of his own at the Gates of Tournay in Flanders, to the Sight of which Spectacle, he called his Friends who were there present, that they might admire it with him. A sudden Shower (saith he) falling spon the very dry Dust, there suddenly appeared such an Army of little Frogs, leaping about every where upon the dry Land, that there was almost nothing else to be seen. They were also of one Magnitude and Colour; neither did it appear out of what lurking Places [Latibula] so many Myriads could creep out, and suddenly discover themselves upon the dry and dusty soil, which they hate. But

*315

having the Reverence due to so great a Man, I doubt not but they did all creep out of their Holes and Coverts, invited by the agreeable Vapour of the Rain-Water. This, however unlikely it may seem, is a thousand Times more probable than their instantaneous and undiscernible Generation out of a little dry Dust and Rain-Water, which also cannot have any time to mix and ferment together, which is the Hypothesis he adheres to. Nay, I affirm, that it is not at all improbable; for he that shall walk out in Summer-Nights, when it begins to grow dark, may observe such a Multitude of great Toads and Frogs crawling about in the High-ways, Paths and Avenues to Houses, Yards and Walks of Gardens and Orchards, that he will wonder whence they came, or where they lurk'd all the Winter, and all the Day-time, for that then it's a rare thing to find one.

To which add, That in such Frogs as we are speaking of, Monsieur Perault hath, upon Dissection, often found the Stomach full of Meat, and the Intestines of Excrement; whence he justly concludes, That they were not then first formed, but only appeared of a sudden; which is no great wonder, since upon a Shower; after a Drought, Earth-Worms and Land-Snails innumerable come out of their lurking Places in like manner.

In Confirmation of what I have here written against the Spontaneous Generation of Frogs, either in the Clouds out of Vapour, or

*316

on the Earth out of Dust and Rain-Water commix’d; endeavouring to prove, by Force of Argument, that there is no such thing, I have lately received from my Learned and Ingenious Friend Mr. William Derham, Rector of Upmister, near Rumford in Essex, a Relation parallel to that of Fromondus, concerning the sudden Appearance of a vast Number of Frogs after a Shower or two of Rain marching cross a sandy way, that before the Rain was very dusty; and giving an Account, where in all Likelihood they were generated by Animal Parents of their own Kind, and whence they did proceed. The whole Narrative I shall give the Reader in his own Words.

"Some Years ago, as I was riding forth one Afternoon in Berks, I happened upon a prodigious Multitude creeping cross the way. It was a standy soil, and the Way had been full of Dust, by Reason of a dry Season that then was. But an Hour or two before a refreshing fragrant Shower or two of Rain had laid the Dust. Whereupon, what I had heard or read of the Raining of Frogs immediately came to my Thoughts, as it easily might do, there being probably as good Reason then for me, as I believe any ever had before, to conclude, that these came from the Clouds, or were instantaneously generated. But being prepossessed
with the contrary Opinion, viz. that there was no equivocal generation, I was very curious in enquiring whence this vast Colony might probably come: and upon searching, I found two or three Acres of Land

*317
cover’d with this black Regiment, and that they all marched the same Way towards some Woods, Ditches, and such like cool Places in their Front, and from large Ponds in their Rear. I traced them backwards, even to the very Side of one of the Ponds. These Ponds in spawning time always used to abound much with Frogs, whose Croaking I have heard at a considerable Distance; and a great deal of Spawn I have found there.

From these Circumstances I concluded, that this vast Colony was bred in those Ponds from whenceward they steered their Course: That after their Incubation (if I may so call it) or Hatching by the Sun, and their having pass’d their Tadpole-state; they had lived (till that Time of their Migration) in the Waters, or rather on the Shore, among the Flags, Rushes, and long Grass: But now being invited out by the refreshing Showers, then newly fallen, which made the Earth cool and moist for their March, that they left their old Latibula, where perhaps they had secured all their proper Food, and were now in Pursuit of Food, or a more convenient Habitation.

This I think not only reasonable to be concluded, but withall so easy to have been discovered by any inquisitive Observer, who in former Times met with the like Appearance, that I cannot but admire that such sagacious Philosophers, as Aristotle, Pliny, and many others since, should ever imagine Frogs to fall down the Clouds, or be any way instantaneously, or spontaneously generated;

*318
especially considering how openly they act their Coition, produce Spawn, this Spawn Tadpoles, and Tadpoles Frogs.

Neither in Frogs only, but also in many other Creatures, as Lice, Flesh-Flies, Silk-Worms, and other Papilios, an uniform regular Generation was very obvious, which is an argument to me of a strange Pre-possession of fancy in the Ages since Aristotle, not to say of Carelessness and Sloth, so far Mr. Derham.

In like manner, doubtless Fromondus, had he made a diligent search, might have found out the Place where those Myriads of Frogs, observed by him about the Gates of Tournay, were generated, and whence they did proceed.

As for the Worms and other Animals bred in the Intestines of Man and Beast, I have declared my self not to be satisfied of the Ways and Means how their Seeds come to be conveyed into those Places; but yet, that their Generation is Analogous to that of other Creatures of those Kinds, I doubt not. The Constancy to their Species; their exact Agreement and perpetual Similitude in the Shape and Figure of their Bodies, and all their Parts; their Consistence, Temper, Motion, and other Accidents, are to me little less than a Demonstration, that they are not the Effects of Chance, but the Products of a settled and spermatick Principle. I am at present, ’till better informed, of Opinion, that their Eggs are swallowed with the Meat we eat; and I am the

*319
rather induced to think so, because Children in their first Infancy, and as long as they are constantly confined to a Milk Diet, are seldom troubled with them.
After this was written, I received a Letter from my often remembred ingenious Friend Dr. Tancred Robinson, referring to this Matter, part whereof I shall transcribe, as being very pertinent, instructive, and consonant to my own Thoughts; “I think it may be proved that the vast Variety of Worms found in almost all the Parts of different Animals, as well Terrestrial as Aquatick, are taken into their respective Bodies by Meats and Drinks, and there either lie still for some time, or else grow and alter by Change of Place and Food, [not specifically, but accidentally, in Magnitude, Colour, Figure of some Parts, or the like.] We know as yet but little of the numerous Insects bred in Water, or indeed of those in Roots, Leaves, Buds, Flowers, Fruits, and Seeds, which we are continually swallowing; and these too all vary according to Climate; [That is, the same Species of Roots, Leaves, etc. do in different Climater produce many different Species of Insects, tho’ some there be common to all; ] the long slender Worms, as small as Hairs, that breed between the Skin and the Flesh in the Isle of Ormuz, and in India, which are generally twisted out upon Sticks or Rowlers, and often break in the Operation, are without doubt taken in by the Water they drink in those Regions, as I could prove by many and good Experiments, had I time. They

*320
who have Leisure, may find them in the Collections of Voyages and Travels, especially in Monsieur Thevenot. By this Explication we may give a better Account of the Vomitings up of Tadpoles, Snails, and other Animals, recorded in Medical Histories, than by any Hypothesis of Equivocal Generation: As to Insects found in stinking Flesh, or rotten Vegetables, I could never observe or find any of them different frgo1; thofie Parent Insects, which hover about or feed upon such Bodies.

If any shall object the infinite Multitudes of Animalcules discovered in Pepper-Water, and desire an Account of their Generation; to him, I shall say, that it is probable, that some few of these Animals may be floating in all Waters, and that finding the Particles of Pepper swimming in the Water, very proper for the cherishing and excluding of their Eggs, by Reason of their Heat, or some other unknown and specifick Quality, they may fasten their Eggs to them, and so there may be a sudden Breed of infinite Swarms of then . But these being not to be discerned by the most piercing and Lyncean sight, without the Assistance of a Microscope, I leave the Manner of their Generation to future Discovery.

No less difficult is it to give an Account of the Original of such Insects as are found and seem to be bred in the Bodies of others of different Kinds. Out of the Sides and Back of the most common Caterpillar, which feeds upon Cabbage, Cole-wort, and Turnep-Leaves,

*321
which we have described in the Catalogue of Cambridge-Plants, we have seen creep out small Maggots, to the Number sometimes of Threescore, or more; which so soon as ever they came forth, began to weave themselves silken Cases of a yellow shining Colour, wherein they changed, and, after some Time, came out thence in the Form of small Flies with four Wings; for a full Description and History whereof, I shall refer the Reader to the forementioned Catalogue. The like I have also observed in other Caterpillars of a different Kind, which have produced no lesser Number of Maggots, that in like manner immediately made themselves up in Cases. Others, instead of changing into Aurelia's, as in the usual Process of Nature they ought to do, have turned into one, two, three, or more Flesh-Fly Cases, at least contained such Cases within them, out of which, after a while, were excluded Flesh-Flies. Other Caterpillars, as that called the solitaty Maggot, found in the dry Heads of Teasel, by a dubious Metamorphosis, sometimes changed into the Aurelia of a Butterfly,
sometimes into a Fly-Case. You'll say, How comes this to pass? Must we not here necessarily have Recourse to a spontaneous Generation? I Answer, No: The most that can be inserred from hence is, a Transmutation of Species; one Insect may, instead of generating another of its own Kind, beget one or more of a different. But I can by no means grant this. I do believe that these Flies

*322
do either cast their Eggs upon the very Bodies of the forementioned Caterpillars, or upon the Leaves on which they feed, all in a String; which there hatching, eat their Way into the Body, where they are nourished till they be come to their full Growth. Or it may be, the Fly may with the hollow and sharp Tube of her Womb punch and perforate the very Skin of the Eruca, and cast her Eggs into its Body. So the Ichneumon will convey her Eggs into Caterpillars

The Discovery of the Manner of the Generation of these sorts of Insects I earnestly recommend to all ingenious Naturalists, as a Matter of great Moment. For if this Point be but cleared, and it be demonstrated that all Creatures are generated univocally by Parents of their own Kind, and that there is no such thing as Spontaneous Generation in the World, one main Prop and Support of Atheism is taken away, and their strongest Hold demolished: they cannot then exemplify their foolish Hypothesis of the Generation of Man and other Animals at first, by the Like of Frogs and Insects at this present Day.

It will be farther objected, that there have live Toads been found in the midst of Timber Trees; nay, of Stones, when they have been sawn asunder.

To this I Answer, that I am not fully satisfied of the Matter of Fact. I am so well acquainted with the Credulity of the Vulgar, and the Delight they, and many of the better

*323
Sort too, have in telling of Wonders and strange Things, that I must have a Thing well attested, before I can give a firm Assent to it.

Since the Writing hereof, the Truth of these Relations of live Toads found in the midst of Stones, hath been confirmed to me by sufficient and credible Eye-witnesses, who have seen them taken out; so that there is no doubt of the Matter of Fact.

But yet, suppose it be true, it may be accounted for. Those Animals, when young and little, finding in the Stone some small Hole reaching to the Middle of it, might, as their Nature is, creep into it, as a fit Latibulum for the Winter, and grow there too big to return back by the Passage by which they enter'd, and so continue imprisoned therein for many Years; a little Air, by Reason of the Coldness of the Creature, and its Lying torpid there, sufficing it for Respiration, and the Humour of the Stone, by Reason it lay immoveable, and spent not, for Nourishment. And I do believe, that if those who found such Toads, had diligently searched, they might have discovered and traced the Way whereby they enter'd in, or some Footsteps of it. Or else there might fall down into the lapideous Matter before it was concrete into a Stone some small Toad, (or some Toad Spawn) which being not able to extricate itself and get out again, might remain there imprisoned till the Matter about it were condensed and

*324
compacted into a Stone. But however it came there, I dare considently affirm, it was not there spontaneously generated. For else, either there was such a Cavity in the Stone before the Toad was generated; which is altogether improbable, and Gratis Dictum, asserted
without any Ground; or the Toad was generated in the solid Stone, which is more unlikely than the other, in that the soft Body of so small a Creature should extend itself in such a Prison, and overcome the Strength and Resistance of such a great and ponderous Mass of solid Stone.

And whereas the Assertors of Equivocal Generation were wont to pretend the Imperfection of there Animals, as a Ground to facilitate the Belief of their Spontaneous Generation; I do affirm, that they are as perfect in their Kind, and as much Art shewn in the Formation of them, as of the greatest; nay more too, in the Judgment of that great Wit and Natural Historian Pliny <margin>Lib 11 cap 2</margin>. In magnis siquidem corporibus, (saith he) aut certe majoribus facilis officina sequaci materia fuit; in his tam parvis atque tam nullis, quae ratio, quanta vis, quam inextricabilis perfectio? In the greater Bodies the Forge was easy, the Matter being ductile and sequacious, obedient to the Hand and Stroke of the Artificer; apt to be drawn, formed or moulded into such Shapes and Machines, even by clumsy Fingers: But in the Formation of these, such diminutive Things, such Nothings, what

*325

Cunning and Curiosity! What Force and Strength was requisite, there being in them such inextricable Perfection!

To what Proofs or Examples of Spontaneous Generation may be brought from Insects bred in the Fruits or Excrencencies of Plants, I have already made Answer in my second Particular, which contains the Testimonies of our best modern Naturalists concerning these Things.

In my Denial of the Spontaneous Generation of Plants, I am not so consident and peremptory; but yet there are the same Objections and Arguments against it, as against that of Animals, viz. because it would be a Production out of indisposed Matter, and consequently a Creation: Or if it be said, there is disposed Matter, prepared by the Earth, or Sun, the Heat, or whatever other Agent you can assign; I reply, this is to make a thing act beyond its Strength, that is, an inserior Nature which hath nothing of Life in it, to prepare Matter for a superior, which hath some Degree of Life; and for the Preparation of which, it hath no convenient Vessels or Instruments. If it could do so, what need of all that apparatus of Vessels, Preparation of Seed, and, as I also suppose, Distinction of Masculine and Feminine that we see in Plants? I demand farther, whether any of the Patrons of Spontaneous Generation in Plants, did ever see any Herbs or Trees, except those of the Grass-leaved Tribe, come up without two Seed-Leaves;

*326

which if they never did or could, it is to me a great Argument that they came all of Seed; there being no Reason else, why they should at first produce two Seed-Leaves different from the Subsequent. And if all these Species which are far the greatest Number) come from Seed, there is not the least reason to think that any of the rest come up spontaneously. And this, with what have written before, may suffice concerning this Point.

Whereas I have often written in many Places that such and such Plants are spontaneous, or come up spontaneously; I mean no more by that Expression, but that they were not planted or sown there industriously by Man.

Having spoken of the Body of Man, and the Uses of its Several Parts and Members, I shall add some other Observations, giving an Account of the particular Structure, Actions and
Uses of some Parts, either common to whole Kinds of Animals, or proper to some particular Species different from those of Man and of the Reason of some Instincts and Actions of Brutes.

First of all, The Manner of Respiration, and the Organs serving thereto in various Animals, are accommodated to their Temper of Body, and their Place and Manner of living; of which I have observed in more perfect Animals three Differences.

*327
1. The hotter Animals, which require abundance of Spirits for their various Motions and Exercises, are provided with Lungs, which indefinently draw in and expel the Air alternately without Intermission, and have a Heart furnished with two Ventricles, because to maintain the Blood in that Degree of Heat, which is requisite to the Performance of the Actions of all the Muscles, there is abundance of Air necessary. I shall not now take notice of the Difference that is between the Lungs of Quadrupeds and Birds, how the one are fixed and immovable, the other loose and moveable; the one perforated, transmitting the Air into large Bladders, the other enclosed with a Membrane.

It is here worth the Notice taking, that many Animals of this Kind, both Birds and Quadrupeds, will endure and bear up against the extremest Rigor of Cold that our Country is exposed to. Horse, Kine and Sheep, as I have experienced, will lie abroad in the open Air upon the cold Ground during our long Winter-Nights, in the sharpest and severest Frosts that ever happened with us, without any Harm or Prejudice at all; whereas one would think, that at least the Extremities of their Members should be bitten, benumbed and mortified thereby. Considering with myself by what Means they were enabled to do this, and to abide and resist the Cold, it occur'd to my Thoughts, that the Extremities of their Toes were fence’d with Hoofs, which in good Measure

*328
secured them: But the main thing was that the Cold is, as it were its own Antidote; for the Air being fully charged and sated with nitrous, or some other sort of Particles which are the great Efficient of Cold, and no less also the Pabulum of Fire) when inspired, doth by means of them cause a great Accension and Heat in the Blood (as we see Fewel burns rashly in such Weather) and so enable it to resist the Impressions of the Cold for so short a time as its more nimble Circulation exposes it thereto, before it comes to another Heating. From hence may an Account be given, why the Inhabitants of hot Countries may endure longer Fasting and Hunger, than those of colder; and those seemingly prodigious, and to us scarce credible, Stories of the Fastings and Abstinence of the Egyptian Monks be render'd probable.

2. Other Animals, which are of a colder Temper, and made to endure a long Inedia or Fasting, and to lie in their Holes almost torpid all Winter, as all Kinds of Serpents and Lizards have indeed Lungs, but do not incessantly breathe, or when they have drawn in the Air, necessarily expire it again, but can retain it at their Pleasure, and live without Respiration whole Days together, as was long since experimented by Sir Thomas Brown, M.D. in a Frog tied by the Foot under Water for that Purpose by him. This Order of Creatures have but one Ventricle in their Heartss and the

*329
whole Blood doth not so often circulate through the Lungs, as it doth through the rest of the Body. This manner of Breathing is sufficient to maintain in them that Degree of Heat which is suitable to their Nature and Manner of Living. For to our Touch they are always cold even in Summer-time, and therefore some will then put Snakes into their Bosom to cool them.
3. Fishes, which were to live and converse always in a cold Element, the Water, and therefore were to have a Temper not excelling in Heat, because otherwise the constant immediate Contract of the Water (unless some extraordinary Provision were made) could not have been supported by them, that they might not be necessitated continually to be coming up to the Top of the Water to draw in the Air, and for many other Reasons that might be alleged, perform their Respiration under Water by the Gills, by which they can receive no more Air than is dispersed in the Pores of the Water; which is sufficient to preserve their Bodies in that Temper of Heat that is suitable to their Nature, and the Place wherein they live. These also have but one Ventricle in their Hearts.

But now, though this be thus, the great and most wise God, as it were, purposely to demonstrate, that he is not by any Condition or Quality of Place necessarily determined to one Manner of Respiration, or one Temper of

*330
Body in Fishes; he hath endued the Bodies of some of that Tribe of Aquatick Creatures with Lungs like viviparous Quadrupeds, and two Ventricles of the Heart, and an Ability of Breathing like them, by drawing in and letting out the open Air; so contriving their Bodies, as to maintain, in the midst of the cold Water, a Degree of Heat Answerable to that of the forementioned Quadrupeds.

Another remarkable thing relating to Respiration, is the keeping the Hole or Passage between the Arteria venoae and Vena cava, called Foramen ovale, open in some amphibious Quadrupeds, viz. the Phoca or Vitulus marinus, called in the English, Sea-Calf and Seal; and, as is generally held, the Beaver too. We have already given the Reason of the twofold Communication of the great Blood-Vessels in the Foetus or Young, so long as it continues in the Womb: The one between the two Veins entering the Heart, by a Hole or Window; the other between the two Arteries, by an Arterial Chanel, extended from the Pulmonary Artery to the Aorta, or great Artery which was, in brief, to divert the Blood from the Lungs. The same Reason for keeping open this Foramen ovale, there is, in these amphibious Creatures; For, 1. The Lungs probably being not extended, but emptied of Air when they abide long under water, and flacid, it is not easy for the whole Blood every Circulation to make its way through them. 2. To maintain that Degree of Heat and Motion in

*331
the Blood, as is sufficient for them while they are under Water, there is not so much Air required, as is when they are above: The Blood then moving but gently, as doth that of the Foetus in the Womb.

Farther, in reference to Respiration, it is observed by the Parisian Academists, that some amphibious Quadrupeds, particularly the Sea-Calf or Seal, hath his Epiglottis extraordinarily large in proportion to other Animals, it extending half an Inch in Length beyond the Glottis to cover it. I believe the Beaver hath the like Epiglottis, exactly clothing the Larynx or Glottis, and hindring all Influx of Water; because in one dissected by Wepferus, that suffocated itself in the Water, there was not a drop of Water found in the Lungs. It is probable (say they) that this is done more exactly to close the Entrance of the Aspera Arteria, or Wind-Pipe, when the Animal eats his Prey at the Bottom of the Sea, and to hinder the Water from running into his Lungs. An Elephant (as is observed by Dr. Moulins, I think, in the Anatomy of that Creature) hath no Epiglottis at all, there being no danger of any thing falling into their Lungs from eating or drinking, seeing there is no Communication between the Oesophagus and it. For he thus describes the Oesophagus or Gullet: The Tongue of this
Creature (saith he) had this peculiar in it, that the Passage to the Ventricle was through it; for there was a Hole near the Root of it, and exactly in the middle of that

*332
Part; which Hole was the Beginning of the Oesophagus. There was no Communication between this and the Passage into the Lungs, contrary to what we may observe in Men, in all Quadrupeds and Fowl, that ever I had opportunity to dissect. For the Membrana pituitaria anterior reached to the very Root of the Tongue below the Oesophagus, and so quite stopped the Passage of the Air into the Mouth. But though there be no danger of Meat or Drink falling into the Lungs, yet were they not sufficiently secured from small Animals creeping in there: For though, to supply in some measure the Want of an Epiglottis by lessening the Glottis, there grew to the Outside of the Cartilages, called Arytenoides, another capable of Motion up and down, by the help of some Muscles that were implanted in it, strong on both sides of the aspera Arteria, but on the Under-side, opposite to that of the Oesophagus very limber, wanting about two Inches and a half of coming round the a foresaid Cartilages on the Upper-side, or the next to the Oesophagus. Yet did not this Cartilage so shut up the way against them, but that even a Mouse creeping up his Proboscis might get into his Lungs and so stifle him: Whence we may guess as the Reason, why the Elephant is afraid of a Mouse: And, therefore, to avoid this Danaer, this Creature [the Elephant, which this Author described] was observed always when he slept to keep his Trunk [Proboscis] so close to the Ground, that nothing but air could get in between

*333
them. This is a strange Sagacity and Providence in this Animal, or else an admirable Instinct.

Again, The Parisian Academists observe of the Sea-Tortoise, that the Cleft of the Glottis was strait and close: Which exact Enclosure, I do rather believe, is to prevent the Water from entering into the Wind-Pipe, when the Tortoises are under Water, than to assist the Effect of the Compression of the Air in the Lungs as they would have it. For they make the main Reason of Respiration, and Use of the Lungs in this Creature, to be, to take in and retain Air; by the Compression and Dilatation whereof, made by the Muscles, it can raise or sink itself in the Water, as need requires; though I do not exclude this. But if this be the main Use of the Lungs and Respiration in this Animal, what is it in Land-Animals, which have a like Conformation of Lungs, and Manner of Respiration, as the Camelion, Serpents, and Lizards?

But before I dismiss the Tortoise, I shall add two notable Observations concerning him, borrowed of the said French Academists, which seem to argue something of Reason in him, and more than a bare Instinct. The first is in the Land-Tortoise; and it is his manner of turning himself, and getting upon his Feet again when he is cast upon his Back, which they describe in these Words: At the great Aperture of the Shell before, there was at the Top a raised Border, to grant more liberty to the Neck

*334
and Head, for lifting themselves upwards. And this Inflexion of the Neck is of great Use to the Tortoises. For it serves them to turn again, when they are upon their Backs. And their Industry upon this Account is very admirable. We have observed in a living Tortoise, that being turned upon its Back, and not being able to make use of its Paws for the returning of itself, because they could not only bend towards the Belly, it could help itself only by its Neck and Head, which is turned sometimes on one side, sometimes on the other, by pushing
against the Ground, to rock itself as in a Cradle, to find out the side towards which the 
Inequality of the Ground might more easily permit it to rowl its Shell. For when it had found 
it, it made all its Endeavours on that Side.

The Second is in the Sea-Tortoise as follows: Aristotle and Pliny have remarked, that when 
Tortoises have been a long time upon the Water during a Calm, it happens that their Shell 
being dried in the Sun, they are easily taken by the Fishermen; by Reason they cannot 
plunge into the Water nimbly enough, being become too light. This shews what Equality 
there ought to be in their AEquilibrium, seeing so little a Change as this, which may happen 
by the sole Drying of the Shell, is capable of making it useless. This easiness to be taken at 
such a time, these Academists do not referr meerly to the Lightness of this Creature's Body, 
(for he could easily let Air enough out of his Lungs to render it heavier than the Water,

*335

and so enable himself to sink) but to a wonderful Sagacity and Caution of this Animal. For 
say they) it is probable that the Tortoise, which is always careful to keep himself in this 
AEquilibrium, so as other Animals are to keep themselves on their Legs, in this case, by the 
same Instinct, dares not let the Air out of his Lungs, to acquire a Weight which might make 
him speedily to sink; because he fears that his Shell being wet, it should become so heavy, 
that he being sunk to the bottom of the Water might never have Power afterwards to re- 
ascend. If this may be the Reason why he exposes himself to the Danger of being taken at 
such a time, rather than he will descend suddenly to the bottom, it is clear, that he is endued 
with an admirable Providence and Foresight, and a Power of Augmentation.

That Nature doth really Design the Preservation and Security of the more infirm Creatures, 
by the defensive Armor that it hath given to some of them, together with Skill to use it, is, I 
think, demonstrable in the common Hedge-hog or Urchin, and one Species of Tatou or 
Armadillo. The Hedge-hog hath his Back-sides and Flanks thick set with strong and sharp 
Prickles, and besides, by the help of a Muscle, given him for that purpose, is enabled to 
contract himself into a Globular Figure, and so to withdraw, enclose and hide his whole 
Under-Part, Head, Belly, and Legs, which, for the Necessities and Conveniencies of Life, 
must be left destitute of this Armor) within his

*336

Covert or Thicket of Prickles; so that Dogs, or other rapacious Creatures, cannot lay hold 
upon him, or bite him, without wounding their own Noses and Mouths. The Muscle, 
whereby he is enabled to draw himself thus together, and gather up his whole Body like a 
Ball, the Parisian Acadcmists describe to be a distinct Carnose Muscle, extended from the 
Ossa innominata to the Ear and Nose, running along the Back-bone, without being fastened 
thereto. Olaus Borrichius, in the Danick Transactions, makes it to be an almost circular 
Muscle, embracing the Panniculus carnosus) of a wonderful Fabrick, variously extending its 
Laciniae or Processes to the Feet, Tail, and Head of the Creature.

The other Creature, which doth thus contract and draw up itself into a Globular or Oval 
Figure for its Defence, is the second sort of Tatou or Armadillo, largely described by 
Marcgrave, lib. 6. cap. 9. by the Name of Tatu apara, which is covered on its Back and Sides 
with a strong scaly Crust or Shell, of a hard or bony Substance, jointed like Armor, or the 
Scales of the Tale of a Lobster, by four transverse Commissures in the middle of the Body, 
connected by tough Membranes. When it sleeps, (as it doth for the most part in the Day- 
time, going forth to feed in the Night) or when one goes about to lay hold on it, gathering up 
its fore and hind Legs as it were to one Point, and drawing its Ears with its Head inward, and 
bringing its Tail to its Head, by Reason of the fore-mentioned Commissures,
it bends its Back so far, till its Head comes to touch its hind Part, and so with Armor gathers itself into a round Ball, the lateral Extremities of the Shell touching one another, and enclosing the Body on the Sides, and the fore and hind Parts coming so near together; that there is nothing to be seen, but the Armature of the Head and Tail, which, like Doors, shut up the Hole, which the Shells of the Body left open. This it performs by the Action of a notable Muscle on each Side, of a great Length, having the Form of the Letter X, made up of many Fibres, decussating one another long ways; by the help whereof, it can contract its Shell, and hold it contracted with such a mighty Force, that he must be a Strong Man indeed that is able to open it.

Had such a Muscle as this, and such an Ability of Contraction been given to any Creature that was covered with soft Hair or Fur, there might have been some Pretence to fancy, that this was accidental and not designed: But seeing there is not one Instance of this Kind in Nature, it must be great Stupidity to believe it, an Impudence to assert it. Neither will the Atheists usual krEsphugatov, or Refuge, That there were indeed at first such Creatures produc'd; but being obnoxious to those that were strong, and rapacious, they were by degrees destroyed, and the Race lost, here help them out: because such a Muscle and Faculty of using it to that Purpose, might as likely have fallen to the Lot or Chance of a strong and generous Creature, which others dared not approach to hurt, who might, for his own Disport, have thus contracted himself into a Ball, of which Kind we find none.

I have before mentioned the Use assigned by the Honourable Mr. Boyle, of famous Memory, lately deceas'd, to the Periophthalmium, or nectating Membrane in Brutes, wherein I could not fully acquiesce as to some Quadrupeds, which were in no danger of having their Eyes harmed by Bushes, and Prickles, or Twigs of Trees; since the Writing whereof, I have met with a different Account of the Use of that Membrane, in the Anatomical Description of several Creatures dissected by the Royal Academy of Sciences at Paris, Englished by Mr. Alexander Pitfield, p.249 in the Description of the Cassowar. Our Opinion (say those Academists) is, that the Membrane serves to clean the Cornea, and to hinder, that by drying, it grow no less transparent. ; Man and the Ape, which are the sole Animals wherein we have not found this Eye-lid, have not wanted this Provision for the cleaning of their Eyes, because that they have Hands, with which they may, by rubbing their Eye-lids, express the Humidity which they contain, and which they let out thro' the ductus lachrymalis which is known by Experience, when the Sight is darkned, or when the Eyes suffer any Pain or Itching: For these Accidents do cease, when the Eyes are rubbed.

But the Direction has distinctly discovered to us the Organs which do particularly serve

for this Use, and which are otherwise in Birds, than in Man, where the Ductus passes not beyond the Glandula lachrymalis. For in Birds it goes beyond; and penetrating above half way on the internal Eye-lid, it is opened underneath upon the Eye: Which is evidently done to spread a Liquor over the whole Cornea, when this Eye-lid passes and repasses; as we observ’d it to do every moment.

The Artifice and Contrivance of Nature, for the extending and withdrawing of this Curtain of the Periophthalmium in Birds, is admirable; but it is difficult so to express it in Words, as
to render it intelligible to the Reader; for a multitude of Words doth rather obscure than illustrate, they being a Burden to the Memory, and the first apt to be forgotten, before we come to the last. So that he that uses many Words for the explaining any Subject, doth, like the Cuttle-Fish, hide himself; for the most part, in his own Ink. And in the Description of the Figure, and Manner of the Extension and Contraction of this Membrane, the Parisian Academists are constrained to use so many Words, that I am afraid few Readers Patience and Attention will last so long, as to comprehend and carry it away: Yet because it is so evident and irrefragable a Proof of Wisdom and Design, I could not omit it. Their Words are these, The Particularities of the admirable Structure of this Eye-lid, are such things as do distinctly discover the Wisdom of Nature, among a thousand others, of which we perceive

not the Contrivance, because we understand them only by the Effects, of which we know not the Causes; but we here treat of a Machine, all the Parts whereof are visible, and which need only to be look'd upon, to discover the Reason of its Motion and Action.

This Internal Eye-lid in Birds is a Membranous Part, which is extended over the Cornea, when it is drawn upon it like a Curtain, by a little Cord or Tendon; and which is drawn back again into the great Corner of the Eye, to uncover the Cornea, by the Means of the very strong Ligaments that it has, and which, in drawing it back towards its Origine, do fold it up. It made a Triangle when extended, and it had the Figure of a Crescent when folded up. Its Basis which is its Origine) was toward the great Corner of the Eye, at the Edge of the great Circle, which the Sclerotica forms when it is flatted before, making an Angle with its anterior Part, that is, the Cornea) which is raised like a Hill upon it. The Basis, which is the Part immoveable, and fastned to the Edge of the Sclerotica, did take up more than a third Part of the Circumference of the great Circle of the Sclerotica: The side of the Triangle, which is toward the little Corner of the Eye, and is moveable, was reinforced with a Border, which supplies the place of the Tarsus, and which is black in most Quadrupeds. This side of the Eye-lid is that which is drawn back into the Corner of the Eye, by the Action of the Fibres of the whole Eye-lid, which parting from

its Origine, proceed to join themselves to its Tarsus.

To extend this Eye-lid over the Cornea, there were two Muscles that were seen, when six were taken away, which serv'd to the Motion of the whole Eye. We found that the greatest of these two Muscles has its Origine at the very Edge of the great Circle of the Sclerotica, towards the great Corner, from whence the Eye-lid takes its Original. It is very fleshly in its Beginning, which is a large Basis, from whence coming insensibly to contract itself by passing under the Globe of the Eye, like as the Eye-lid passes over it, it approaches the Optick Nerve, where it produces a Tendon round and slender, so that it passes through the Tendon of the other Muscle, which serves for a Pully, and which hinders it from pressing the Optick Nerve upon which it is bent, and makes an Angle, to pass through it to the upper Part of the Eye; and coming out from underneath the Eye to insert itself at the Corner of the Membrane, which makes the Internal Eye-lid. This second Muscle hath its Original at the same Circle of the Sclerotica, but opposite to the first towards the little Corner of the Eye, and passing under the Eye like the other, goes to meet it, and embraces its Tendon, as has been declared.

The Action of these two Muscles is, in respect to the first, to draw by the means of its Cord or Tendon the Corner of the Internal Eye-lid, and to extend it over the Cornea. As
**342**
to the second Muscle, its Act in is by making its Tendon to approach towards its Origine, to
hinder the Cord of the first Muscle which it embraces, from hurting the Optick Nerve; but
its principal Use is, to assist the Action of the first Muscle. And 'tis herein that the
Mechanism is marvellous in this Structure, which makes that these two Muscles joined
together, do draw much farther than if it had but one for the Inflection of the Cord of the
first Muscle, which causes it to make an Angle on the Optick Nerve, is made only for this
End: And a single Muscle with a strait Tendon, had been sufficient, if it had Power to draw
far enough. But the Traction which must make the Eyelid extend over the whole Cornea,
being necessarily great, it could not be done but by a very long Muscle, and such a Muscle
not being able to be lodg'd in the Eye all its Length, there was no better Way to supply the
Action of a long Muscle, than by that of two indifferent ones, and by bending one of them,
to give it the greater Length in a little Space. Thus far the Academists, who themselves
reflecting on the Length and Obscurity of this Description, tell us, that the Inspection of the
Figure, will serve greatly to the Understanding of it, which the Novelty of the Thing renders
obscure in itself; and so I fear it will be to most Readers; howbeit in such a Work as this, I
ought not by any means, as I said before, to leave out such a notable Instance,

**343**
wherein Contrivance and Design do so clearly and undeniably appear.

The same Academists, as I remember, tell us, that they have found by Experience, that the
aqueous Humour of the Eye will not freeze; which is very admirable, seeing it hath the
Perspicuity and Fluidity of common Water, and hath not been taken Notice of; so far as I
have heard, to have any eminent Quality discoverable, either by Taste or Smell; so that it
must be of some Singular and Ethereal Nature: And deserves to be examined and annalized
by the curious Naturalists of our Times.

The Providence of Nature is wonderful in a Camel, or Dromedary, both in the Structure of
his Body, and in the Provision that is made for the Sustenance of it. Concerning the first, I
shall instance only in the Make of his Foot, the Sole whereof, as the Parisian Academists do
observe, is flat and broad, being very fleshy, and covered only with a thick, soft, and
somewhat callous Skin, but very fit and proper to travel in sandy Places; such as are the
Desarts of Africk and Asia. We thought (say they) that this Skin was like a living Sole,
which wore not with the Swiftness and the Continuance of the March, for which this Animal
is almost indefatigable. And it may be this softness of the Foot, which yields and fits itself to
the Ruggedness and Uneavenness of the Roads, does render the Feet less capable of being
worn, than if they were more solid.

**344**
As to the Second, the Provision that is made for their Sustenance in their continued Travels
over sandy Desarts, the same Academists observe, That at the Top of the second Ventricle
(for they are ruminant Creatures, and have four Stomachs) there were several square Holes,
which were the Orifices of about twenty Cavities, made like Sacks placed between the two
Membranes, which do compose the Substance of this Ventricle. The View of these Sacks
made us to think, that they might well be the Reservatories, where Pliny says, that Camels
do a long time keep the Water, which they drink in great Abundance when they meet with it,
to supply the Wants which they may have thereof in the dry Desarts, wherein they are used
to travel; and where it is said, that those that do guide them, are sometimes forced, by
Extremity of Thirst, to open their Bellies, in which they do find Water.
That such an Animal as this, so patient of long thirst, should be bred in such droughty and parched Countries, where it is of such eminent Use for travelling over those dry and sandy Desarts, where no Water is to be had sometimes in two or three Days Journey, no candid and considerable Person but must needs acknowledge to be an Effect of Providence and Design.

Such Animals as feed naturally upon Flesh, both Quadrupeds and Birds, because such kind of Food is high and rank, do qualify it, the one by swallowing the Hair or Fur of the

*345 Beasts they prey upon, the other by devouring some Part of the Feathers of the Birds they gorge themselves with, not electively, but because they cannot, or will not, take the Pains fully to plume them. And therefore the Parisian Academists do rationally refer the Death of one of the Lions whom they dissected to the Feeding of him with too succulent and delicate Meat. For (say they) we know, that some time before his Death he was several Months without going out of his Den and that it was hard to make him eat. That for this Reason some Remedies were prescribed to him, and among others the eating only the Flesh of young Animals, and those alive. And that those which look’d to the Bears of the Park of Vicennes, to make this Food more delicate, did use a Method very extraordinary; which was, they flead Lambs alive, and thus made him eat several; which at the first revived him, creating in him an Appetite, and making him brisk. But it is probable that this Food engender’d too much Blood, and which was too subtile for an Animal to whom Nature had not given the Industry of fleing those which he eat. It being credible, that the Hair, Wool, Feathers and Scales, which all Animals of Prey do swallow, are a reasonable and necessary corrective, to prevent their Greediness from filling themselves with too succulent a Food.

Though I have declared in the Beginning of this Work, that the Means whereby cartilaginous

*346 Fishes raise and sink themselves in the Water, and rest and abide in what Depth they Please, is not yet certainly known; yet I shall propound a Conjecture concerning it, which was first suggested to me by Mr. Peter Dent, late Physician in Cambridge, viz. that it is by the help of Water which they take in and let out by two Holes in the lower Part of their Abdomen, or Belly, near the Vent) or not far off it. The Flesh of this sort of Fish being lax and spungey, and nothing so firm, solid and weighty, as that of the Bony Fishes; and there being a good Quantity of Air contained in the Cavity of their Abdomen, they cannot sink in the Water, without letting in some of it by these Holes (the Orifices whereof are opened and shut at Pleasure by the help of Muscles provided for that purpose) into the Hollow of their Bellies, whereby they preponderate the Water; and descend; and when they would ascend by a Compression wrought by the Muscles of the Abdomen they force out the Water again, or at least so much of it as may suffice to give that Degree of Levity they need or desire. If it be found, by Experience, that the Bodies of these Fishes, without this Ballast would naturally float in the Water, and that they do really admit Water into their Bellies, then this Conjecture may have some Probability or Truth in it, otherwise not.

Upon the Contemplation and Consideration of those various Ways and Contrivances which Nature (I mean the Divine Wisdom) hath

*347 made use of for preparing the Chyle, separating the nutritious Juice from the grosser Parts of the Aliment, and the several Humours and Spirits from the Blood, I cannot but admire her great Wisdom, Art and Curiosity. For she hath not only employed all those Methods and
Devices, which Chymists have either learned by Imitation of her, or invented of themselves, for annalizing of Bodies, separating their Parts, the pure from the impure, and extracting their Spirits, etc. as Maceration in the first Stomach or Paunch of ruminating Creatures, and in the Craws of Birds; Commination by grinding in the Mouths of viviparous Quadrupeds, and in the Gizzards of Poultry; Fermentation in the Stomachs of most Terrestrial, and all Aquatick Animals; Expression and Squeezing, in the Omasus of ruminant Quadrupeds, and in the Intestines of all Creatures, by the Motion of the Midriff, and other Muscles of the Belly, forcing the Chyle out of the Faeces, or Excrements, into the Lacteal Veins; Straining, or Percolation, by all the Viscera of the Body; which use but as so many Colanders to separate several Juices from the Blood: And, lastly, Digestion and Circulation, in the Spermatick Parts and Vessels, and perhaps also in the Brain. I say, it hath not only made use of these Operations, but it hath quite out-done the Chymists, effecting that by a gentle Heat, which they cannot perform without great Stress of Fire. As for Instance, in the Stomach of a Dog, preparing a Liquor

*348 that dissolves Bones; and in the Bodies of some Insects, a Liquor which seems to be as highly acid and corrosive, as Oil of Vitriol, or Spirit of Nitre, viz. that which is instilled into the Blood when they sting. It is an Experiment I have met with in some Books, and made myself, that if you put Blue-Bottles or other blue Flowers into an Ant-Hill, they will presently be stained with red: The Reason which these Authors render not is because the Ants thrust in their Stings into the Flowers, and instil into or drop upon them a small Mite of their stinging Liquor, which hath the same Effect that Oil of Vitriol would have in changing their Colour, which is a Sign that both Liquors are of the same Nature.

Casper Bartholine hath observed, that where the Gullet perforates the Midriff, the carnosous Fibres of that muscular Part are inflected and arcuate, as it were a Sphincter embracing and closing it fast, by a great Providence of Nature, lest in the perpetual Motion of the Diaphragm, the upper Orifice of the Stomach should gape, and cast out the Victuals as fast as it received it. And Peyesus thinks he hath Observed, that in ruminating Creatures the Connection of the Gullet with the Diaphragm is far straiter and stronger than in Man and other Animals, to the end that there should not be more than one Morsel forced out at once. For that external Sphincter inhibits a too great Dilatation of the Gullet, and doth as it were

*349 measure out the Morsels, and fit them to the Capacity of the Oesophagus.

I shall conclude with a notable Relation of Galen's, lib. 6. de locis effectis, cap. 6. concerning a Kid taken by him alive out of the Dam's Belly, and nourished and brought up.

<Greek>

‘H diaplasasa te ka teleiOsasa physis eirgasato chOris didaskalias epi oikeian energeian erchesthai; kai basanon ge tQtQ megizEn epoiEsamEn pote threpsas epiphon, aneu tQ Theasasthai pote tEn kuEsasan; aigas gar egEumanon anatemOn heneka tOn ezEtEmenOn theOrEmatOn tois anatomikois andresi peri tEs kata to kuQmenon oikonomias, heurOn pote theasasthai tEn kuEsasan eis oikon men tina komisas katethEka, pollamen echnota lekania; to men oivQ, to de elaiQ, to de galaktos, E allQ tinos hugrQ plEres, oik oliga d’allQ tOn DEEmEtriOn karpOn, hOsper de ka tOn akrodruOn; etheasametha de to embruon ekeino, prOton men badizon tois posin, hOsper akEkoOs heneka badiseOs echoin ta skelE; deuteron de apoieimenon tEn ek tEs mEtras hugrotEta, kai trion epi tQtO kusamenon heni tOn podOn tEn pleuran, c’ osmOmenon eidomen auto tOn keimenOn kata ton oikon
Nature forming, fashioning and perfecting the Parts of the Body; hath so brought it to pass, that they would of themselves, without any teaching, set about and perform their proper Actions: And of this I once made a great Experiment, bringing up a Kid without ever seeing its Dam. For dissecting some Goats great with Young, to resolve some Questions mnde by Anatomists, concerning the Oeconomy of Nature in the Formation of the Foetus in the Womb; and finding a brisk Embryon, [young one] I loosed it from the Matrix after our usual manner, and snatching it away, before it saw its Dam, I brought it into a certain Room; having many Vessels full, some of Wine, some of Oil, some of

Honey, some of Milk, or some other Liquor; and others, not a few, filled with all forts of Grain, as also with several Fruits, and there laid it. This Embryon we saw first of all getting up on its Feet and walking, as if it had heard, that its Legs were given it for that purpose; next Shaking of the Slime it was besmeared with from the Womb; and moreover, thirdly, scratching its Side with one of his Feet; then we saw it smelling to every one of those Things that were put in the Room; and when it had smelt to them all, it supped up the Milk; whereupon we all for Admiration cried out, seeing clearly the Truth of what Hypocrates saith, that the Natures and Actions of Animals are not taught, (but by Instinct). Hereupon I nourished and reared this Kid, and observed it afterwards not only to eat Milk, but some other things that stood by it. And the Time when this Kid was taken out of the Womb being about the Vernal Equinox, after some two Months were brought into it the tender Sprouts of Shrubs and Plants, and it again smelling of all of them, instantly refused some, but was Pleased to taste others, and after it had tasted, began to eat of such are the usual Food of Goats. Perchance this may seem a small thing, but what I shall now relate is great. For eating the Leaves and tender Sprouts, it swallowed them down, and then a while after it began to chew the Cud; which all that saw cried out again with Admiration, being astonished at the Instincts and natural Faculties of Animals.

For it was a great thing that when the Creature was hungry, it should take in the Food by the Mouth, and chew it with its Teeth; but that it should bring up again into the Mouth that which it had swallowed down into its Stomach; and chewing it there a long time, it should
grind and smooth it, afterwards swallow it again, not into the same Stomach, but into another, seemed to us wonderful indeed. But many neglect such Works of Nature, admiring only strange and unusual Sights.” So far Galen.

This pleasant and admirable Story, should one consider all the Particulars of it; and endeavour to give an Account of them, as also all the Inferences that might be drawn from it, one might fill a whole Volume with Comments upon it. All that I shall at present say is this, That in all this Oeconomy, and these Actions, Counsel and Design doth so clearly appear, that he must needs be very stupid that doth not discern it, or impudent, that can deny it. I might add, That there seems to be something more than can be performed by meer Mechanism in the Election this Creature made of its Food: For before it would eat of any, it smelt to all the Liquors before it, and when it had done so, betook itself to the Milk, and devoured that. He doth not say that the Milk was the last Liquor it smelt to, or that when it had once smelt to that, it presently drank it up. The like also he saith of

*353 all the Sprouts and Branches of Plants that were laid before it. By the by, we may take Notice of one thing very remarkable, that this Kid of its own Accord drank Milk, after the manner it had done in the womb; whereas had it once drawn by the Nipple, it would hardly have sipp'd the Milk. And therefore in weaning young Creatures, the best Way is never to let them suck the Paps at all, for then they will drink up Milk without any Difficulty; whereas, if they have Suck'd, some will very hardly, others, by no means, be brought, to drink. But how do the Young with such Facility come to take the Nipple, and to suck at it, which they had never before used to do? Here we must have Recourse to Natural Instinct, and the Direction of some Superiour Cause.

Notice hath been already taken in an Observation communicated by my Learned Friend Dr. Tancred Robinpon, of the Providence of Nature in so forming the Membranes of the Body, as to be capable of a prodigious Dilatation and Extension; which is of great Use in some Diseases; for Example, the Dropsy, to continue Life for some time, till Remedy may be had; and if not, to give Time to prepare for Death. But the Wisdom and Design of this Texture doth in no Instance more clearly appear, than in the Necessity of it for the Womb in the Time of Gestation. For were not the Womb in Women, which, during Virginity, is not bigger than a small Purse,

*354 almost infinitely Dilatable, and also the Peritoneum, not to mention the Skin, and the Cuticula; how were it possible it should contain the Child, nay sometimes Twins, with all their Appurtenances, the Secundines, the Placenta, the Liquor or Waters, and what else is necessary for the Defence, Nutrition, Respiration, and soft and convenient Lodging of them, till they come to their due Perfection and Maturity for Exclusion? How could the Child have room to grow there to his Bigness, and stir and turn himself as is requisite? Add hereto another Observation of Blasius’s, particularly relating to this Subject: He hath observed, that the Vessels of the interieu glandulous Substance of the Womb are strangely contorted and reflected with Turnings and Meanders, that they might not be too much strained, but their Folds being extended and abolished, they might accommodate themselves without Danger of Rupture to the necessary Extension of the Uterine Substance at that Time.

Another remarkable Proof of Council, and Design may be fetch'd from the Formation of the veins and arteries near the heart, which I meet with in Dr. Lower's Treatise De Corde. Just before the Entrance of the Right Auricle of the heart, (saith he) to wit, where the ascending Trunk of the Vena Cava meeting with the descending, is ready to empty itself into the said
right auricle, there occurs in it a very remarkable Knob or Bunch [Tuberculum] raised up from the subjacent Fat, by the Interposition

*355

whereof the Blood falling down by the descending Vein, is diverted into the Auricle, which otherwise encountering and bearing upon that of the ascendent Trunk, would very much hinder and retard the Motion of it upward towards the Heart: And because in an erect Site and Figure of the Body there is a greater and more eminent Danger of such an Accident, therefore the Vena Cava in Mankind hath this Tubercle far greater, and more extant than it is in Brutes, so that if you thrust your finger into either Trunk, you can hardly find Passage or Admittance into the other.

But in Quadrupeds, as in Sheep, Dogs, Horse, Kine, in which the Course of the Blood from either Extreme of the Body is more equal, and, as it were, in a plainer Level, and because the Heart, by Reason of its Bulk and Weight, hanging downwards, both Trunks of the Vena Cava have some little Declivity towards it, there is no need of so great a Bar and Diversion in them; yet are they not altogether devoid of it.

Moreover, lest the Blood here in its Conflux should make a Kind of Flood and Whirlpool, whilst the Auricle being contracted doth not give it free Ingress, therefore, in this place, the Vena Cava in great Animals, as well Man as Quadrupeds, is round-about Musculous; as well that it may be restrain'd and kept within its due Limits of Extension, as that it may more vigorously, and strongly urge and impel the Blood into the Cavity of the Auricle.

*356

Besides, there is no less Providence and Caution used, that the Blood, when it is forcibly cast out of the Left Ventricle of the Heart, be not unequally distributed to the superior or inferior Parts. For whereas this Gate or Orifice of the Heart opens right upwards, if that Channel, which receives the first Impulse of the Blood, did lead in a strait Line up to the Region of the Head, it could not be, but that it must be poured too swiftly upon the Brain, and so the inferior Parts of the Body must needs be defrauded of their vital Liquor and Aliment. Which Inconvenience, that the divine Architect of the Body might wholly obviate and avoid, in Animals whose Hearts are more strongly moved; he so artificially contrived the Trunk of the Aorta, which is next the Heart, that the Blood runs not directly into the Axillary and Carotide Arteries, but doth as it were fetch a Compass: For in the middle Space between the Ventricle and those Arteries, it is very much inflected or bent; whence it comes to pass, that that crooked Angle sustains the Force and first Stroke of the ejected Blood, and directs the greatest Torrent of it towards the descending Trunk of the Aorta, which otherwise would rush too forcibly into the superior branches thereof, distending them immoderately, and soon oppress and burden the Head. so gar Dr. Lowther.

To elude or evade the Force of all these Instances, and innumerable others, which might be produced, to demonstrate, that the Bodies

*357

of Men and all other Animals were the Effects of the Wisdom and Power of an intelligent and almighty Agent, and the Several Parts and Members of them designed to the Uses to which now they serve, the Atheist hath one Subterfuge, in which he most consides, viz. That all these Uses of Parts are no more than what is necessary to the very Existence of the Things to whom they belong: And what Things made Uses, and not Uses Things.
And having Instanced in several Members, he concludes,

I shall give you their Sense, together with the Confutation of it in Dr. Bentley's Words, borrowed out of his Fifth Lecture, &c.

“These Things (say the Atheists) are mistaken for Tokens of Skill and Contrivance, whereas they are but necessary Consequences of the present existence of those Creatures to which they belong: For he that supposeth any Animals to subsist, doth, by that very Supposition, allow them every Member and Faculty that are necessary to

*358
Subsistence. And, therefore, unless we can prove a priori, and independent on this Usefulness, now that Things are once supposed to have existed and propagated; that among almost infinite Trials and Essays at the Beginning of Things, among Millions of monstrous Shapes and imperfect Formations, a few such Animals as now exist could not possibly be produced, these After-Considerations are of very little Moment: because, if such Animals could in that way possibly be formed, as might live, and move, and propagate their Beings, all this admired and applauded Usefulness of their several Fabricks is but a necessary Condition and Consequence of their Existence and Propagation.

This is the last Pretence and Sophistry of the Atheists against the Proposition in my Text, [Acts xvii 27] That we received our Life and Being from a Divine Wisdom and Power. And as they cannot justly accuse me of concealing or baulking their Grand Objection, so, I believe, these following Considerations will give them no Reason to boast that it cannot receive a just and satisfactory Answer.

(1.) First, therefore, we affirm that we can prove a priori, which is the Challenge of the Atheists) that these Animals that now exist, could not possibly have been formed at first by Millions of Trials. For seeing they allow by their very Hypothessis, (and without standing to that Courtesy, we have proved it before) that there

*359
can be no casual or spontaneous Motion of the Particles of Matter; it will follow, that every single Monster, among so many supposed Myriads, must have been mechanically and necessarily formed, according to the known Laws of Motion, and the Temperament and Quality of the Matter it was made of. Which is sufficient, that no such Monsters were or could have been formed. For to denominate them even Monsters, they must have had some rude Kind of Organical Bodies, some Stamina of Life, though never so clumsy, some system of Parts, compounded of solids and Liquids, that executed (though but bunglingly) their peculiar Motions and Functions. But we have lately shewn it impossible for Nature, unassisted, to constitute such Bodies, whose Structure is against the Law of specifick Gravity. So that she could not make the least Endeavour towards the producing of a Monster, or of any thing that hath more Vital and Organical Parts than we find in a Rock of Marble, or a Fountain of Water. And again, though we should not contend with them about their Monsters and Abortions, yet seeing that they suppose, even the perfect Animals, that are still in Being, to have been formed mechanically among the rest, and only add some Millions of Monsters to the Reckoning. They are liable to all the Difficulties in the former
Explication, and are expressly refuted through the whole preceding Sermon, where it is abundantly shewn, that a spontaneous Production is against the

*360

Catholick Laws of Motion, and against Matter of Fact, a Thing without Example, not only in Man and the nobler Animals, but in the Smallest of Insects, and the Vilest of Weeds: Though the Fertility of the Earth cannot be said to have been impaired since the Beginning of the World.

(2.) Secondly, We may observe, that this Evasion of the Atheist is fitted only to elude such Arguments of divine Wisdom as are taken from Things necessary to the Conservation of the Animal, as the Faculties of Sight, and Motion, and Nutrition, and the like; because such usefulness is indeed included in a general Supposition of the Existence of that Animal, but it miserably fails him against other Reasons, from such Members and Powers of the Body as are not necessary absolutely to Living and Propagating, but only much conduces to our better Subsistence and happier Condition. So the most obvious Contemplation of the Frame of our Bodies, as that we all have double Sensories, two Eyes, two Ears, two Nostrils, is an effectual Confutation of this Atheistical Sophism. For a double Organ of these Senses is not at all comprehended in the Notion of bare Existence; one of them being sufficient to have preserved Life, and continued the Species, as common Experience witnesseth. Nay, even the very Nails of our Fingers are an infallible Token of Design and Contrivance; for they are useful and convenient to give Strength and Firmness to those Parts in the various Functions they are put to; and to defend the numerous Nerves and Tendons that are under them, which have a most exquisite Sense of Pain, and without that native Armour would continually be exposed to it. It is manifest, therefore, that there was a Contrivance and Foresight of the Usefulness of Nails, antecedent to their Formation.

*361

For the old stale Pretence of the Atheists, that Things were first made fortuitously, and afterwards their Usefulness was observed or discovered, can have no Place here; unless Nails were either absolutely requisite to the Existence of Mankind, or were found only in some Individuals, or some Nations of Men, and so might be ascribed to Necessity upon one Account, or to Fortune upon another. But from the Atheists Supposition, that among the infinite Diversity of the first Terrestrial Productions, there were Animals of all imaginable Shapes and Structures of Body, all of which survived and multiplied, that by Reason of their Make and Fabrick could possibly do so, it necessarily follows, that we should now have some Nations without Nails upon their Fingers, others with one Eye only, as the Poets describe the Cyclopes in Sicily, and the Arimaspi in Scythia; others with one Ear, or with one Nostril, or indeed without any Organ of Smelling, because that Sense is not necessary to Man's Subsistence; others destitute of the Use of Language, seeing that Mutes also may live. One People would have the Feet of Goats, as the feigned Saytrs and Panisci:

*362

Another would resemble the Head of Jupiter Ammon, or the horned Statues of Bacchus; the Scipodes and Enotocetae, and other monstrous Nations, would be no longer Fables, but real Instances in Nature: And, in a Word, all the ridiculous and extravagant Shapes the can be imagined, all the Fancies and Whimsies of Poets and Painters, and AEgyptian Idolaters, if so be they are consistent with Life and Propagation, would be now actually in being if our Atheists Notion were true: Which therefore may deservedly pass for a meer Dream and an Error, till they Please to make new discoveries in the Terra incognita, and bring along with them some Savages of all these fabulous and monstrous Configuratious. Thus far Dr.
Bentley, who adds four Considerations more to confute this Fancy, ex abundanti, granting the Atheist all the absurd Suppositions he can make. For which, though they be very well worth the reading, yet being too long to transcribe, I refer the Reader to the Sermon itself.

I shall now farther prove by a notable Instance, that Uses made Things, that is to say, that some things were made designedly and on purpose for such an Use as they serve to; and that is, the Tendrels or Claspers of Plants, because they are given only to such Species as have weak and infirm Stalks, and cannot raise up, or support themselves by their own Strength. We see not so much as one Tree, or Shrub, or Herb, that hath a firm and strong Stem, and that is able to mount up and stand alone without Assistance, furnished with them. Whereas, had they been, without Design, scattered (as I may say) indifferently and carelessly among Plants, it could not possibly have happened, but among so many thousand Species, they must have fallen to the Lot of some few, at least, one of the Strong, and not only of the Weak. The same hath been proved by the Instance of the Power given to the Hedgehog and Armadillo, of contracting their Bodies into a globular Figure, and so hiding and securing their tender and unarmed Parts.

2. I shall prove by another eminent Instance, that Things did not make uses, because there is a sort of Creatures which have all the Parts and Organs which are fitted for a certain Action, and employed for the Exercise of it by another sort; and yet make no use of them for that Purpose: That is, the Ape-kind. The Parisian Academists, in their Anatomy of some Animals of this Kind, tell us, that the Muscles of the Os Hyoides, Tongue, Larynx, and Pharynx, which do most serve to articulate a Word, were wholly like to those of Man, and a great deal more than those of the Hand; which, nevertheless, the Ape, which speaks not, uses with as much Perfection as a Man. Which demonstrates, that Speech is an Action more peculiar to Man, and which more distinguishes him from Brutes, than the Hand, which Anaxagoras, Aristotle, and Galen, have thought to be the Organ, which Nature has given to Man, as to the wisest of all Animals;

for want perhaps of this Reflexion: For the Ape is found provided by Nature of all those marvellous Organs of Speech, with so much Exactness, that the very three small Muscles, which do take their Rise from the Apothesis Styloides, are not wanting, although this Apothesis be extremely small. This Particularity does likewise shew, that there is no Reason to think, that Agents do perform such and such Actions, because they are found with Organs proper thereunto: For, according to these Philosophers, Apes should speak, seeing that they have all the Instruments necessary for Speech. All this is confirmed and approved by the learned and accurate Dr. Tyson, in his Anatorn of the Orang Outrang, or Pigmy, he finding in the Animal he describ'd, which was of the Ape-kind) the whole Structure of the Larynx and Os Hyoides exactly as 'tis in Man. And the Reflexion which the Parisians make upon their Observation of these and the neighbouring Parts, he thinks very just and valuable and adds farther; that this is not the only Instance, which may justify such an Insurence, though he thinks it so strong an one, as the AtheiSts can never Answer.

It is farther considerable, and adds to the Weight of this Instance, that though Birds have been taught to imitate Humane Voice, and to pronounce Words, ye Sentences, yet Quadrupeds never; though they have Organs far more fit for that Purpose, and some of them, viz. Dogs, and Horses, converse almost perpetually.
with Men; and others, as Apes, are given naturally to imitate Mens Actions; as if Providence had designed purposely to confute this fond Conceit of the Atheists, by denying them the Power to make use of these Organs of Speech, which, whether they understand what they said or not, they otherwise might and would have done in Imitation of Man, and that to greater Perfection than Birds do, or are capable of doing.

Farther, to prove that those nobler Faculties of the Soul, Reason, and Understanding, cannot be produced by Matter organized, but must have a higher Principle, he <margin>Dr. Tyson</margin> thus argues; “It is an Observation of Vesalius’s, that the Brain of Man, in respect of his Body, is much larger than what is to be met with in any other Animals, exceeding in Bigness three Oxes Brains; whence he inseres, that as Animals excel in the Largeness of the Brain, so they do likewise in the principal Faculties of the soul; which Insence the Doctor cannot allow.

It is (saith he) a generally received Opinion, that the Brain is the immediate Seat of the soul itself, whence one would be apt to think, that seeing there is so great a Disparity between the soul of a Man and a Brute, the Organ, in which it is placed, should be very different too; yet, by comparing the Brain of our Pigmy [the Orang-Outrang, or Wild-Man] with that of a Man, and with the greatest Exactness of observing each Part in both, it

was very surprizing to me to find so great a Resemblance of the one to the other, as nothing could be more; and that in Proportion to its Body, its Brain was also as large as a Man’s.

Since therefore (he proceeds) the Brain of our Pigmy does in all respects so exactly resemble a Man’s, I might here make the same reflexion the Parisians did upon the Organs of Speech, that there is no Reason to think, that Agents do perform such and such Actions, because they are found with Organs proper thereunto; for then our Pigmy might be really a Man. The Organs in Animal Bodies, are only a regular Campanage of Pipes and Vessels for the Fluids to pass thro’, and are passive. What actuates them, are the Humours and Fluids: And Animal Life consists in their due and regular Motion in this organical Body. But those nobler Faculties in the Mind of Man, must certainly have a higher Principle, as Matter organized could never produce them: For why else, where the Organ is the same, should not the Action be the same too?

Object. Some may here object and argue, if the Body of Man be thus perfect, why did God make any other Animals? For the most perfect Being the best, an infinitely good Agent, which wants neither Wisdom nor Power, should (one would think) only produce the most perfect.

Answer. To which I Answer, 1. That according to this Argumentation, one might inser that God must produce but one kind of Creature,

and that the most Perfect that he is able, which is impossible: For he being Infinite in all Perfection, cannot act <latin>ad extremum virium,</latin> unless he could produce an Infinite Creature, that is, another God, which is a Contradiction: But whatever he makes, must want Degrees of Infinite Perfection, of which he could sttill (if he pleased) add more and more to it.

2. The inseriour Creatures are perfect in their Order and Degree, wanting no Quality or Perfection that is necessary or due to their Nature and Condition, their Place and Manner of
Living. Now, why God might not make several subordinate Ranks and Degrees of Creatures, they being good, I see no Reason.

3. These several Ranks and Degrees of Creatures are subservient one to another; and the most of them serviceable, and all, some way or other, useful to Man; so that he could not well have been without them.

4. God made these several Orders and Degrees, and in each Degree so many Varieties of Creatures, for the Manifestation and Displaying of his Infinite Power and Wisdom. For we have shewn before, by a familiar Instance, that there is more Art and Wisdom shewn in contriving and forming, a Multitude of different Kinds of Engines, than in one only.

5. Yet do I not think, that he made all these Creatures to no other End, but to be Serviceable to Man, but also to Partake themselves of his overflowing Goodness, and to enjoy their own Beings. If we admit all other creatures in this inseriour World besides Man, to be meer Machines, or Automata, to have no Life, no Sense, or Perception of any Thing, then, I confess, this Reason is out of doors; for being uncapable of Pleasure or Pain, they can have no Enjoyment. Upon this account, also among others, I am less inclinable to that Opinion.

I should now proceed to Answer some Objections which might be made against the Wisdom and Goodness of God in the Contrivance and Governance of the World, and all Creatures therein contained. But that is too great and difficult a Task for my Weakness, and would take up more Time than I have at present to spare, were I qualified for it, and besides swell this Volume to too great a Bulk. Only I shall say something to one Particular, which was suggested to me by a Learned and Pious Friend <margin>Mr. Robert Burscough of Totness, in Devon</margin>.

Objection. A wise Agent acts for Ends. Now what End can there be of creating such a vast Multitude of Insects, as the World is fill'd with; most of which seems to be useless, and some also noxious and pernicious to Man, and other Creatures?

Answer. To this I shall answer,
1. As to the Multitude of species or Kinds.
2. As to the Number of Individuals in each Kind.

First, As to the Multitude of Species, which we must needs acknowledge to be exceeding great, they being not fewer, perchance

*369
more, than 20000). I answer, there were so many made,

1. To manifest and display the Riches of the Power and Wisdom of God, Psalm civ 24
   “The Earth is full of thy Riches; so is this great and wide Sea, wherein are Things creeping innumerable, &c.” We should be apt to think too meanly of those Attributes of our Creator should we ever be able to come to an End of all his Works, even in this Sublunary World. And therefore, I believe, never any Man yet did, never any Man shall, so long as the World endures, by his utmost Industry, attain to the Knowledge of all the Species of Nature. Hitherto we have been so far from it, that in Vegetables, the Number of those which have been discovered this last Age, hath far exceeded that of all those which were known before. So true is that we quoted before out of Seneca
Pusilla rer ejZ I nundus, ni/i in eo qaod q–rat omlir, 7nundlls habeat. The World is so richly furnished and provided, that Man need not fear want of Employment, should he live to the Age of Methuselah, or ten times as long. But of this, having touched it already, I shall add no more.

2. Another reason why so many Kinds of Creatures were made, might be to exercise the contemplative Faculty of Man; which is in nothing so much pleas’d, as in Variety of Objects. We soon grow weary of one Study; and if all the Objects of the World could be comprehended by us, we should, with Alexander,

*370
think the World too little for us, and grow weary of running in a Round of seeing the same Things. New Objects afford us great Delight, especially if found out by our own Industry. I remember Clusius saith of himself, "That upon the Discovery of a new Plant, he did not less rejoice, than if he had found a rich Treasure." Thus God is pleased, by reserving Things to be found out by our Pains and Industry, to provide us Employment most delightful and agreeable to our Natures and Inclinations.

3. Many of these Creatures may be useful to us, whose Uses are not yet discovered, but reserved for the Generations to come, as the Uses of some we now know are but of late Invention, and were unknown to our Forefathers. And this must needs be so, because, as I said before, the World is too great for any Man, or Generation of Men, by his, or their utmost Endeavours, to discover and find out all its Store and Furniture, all its Riches and Treasures.

Secondly, As to the Multitude of Individuals in each Kind of Insect. I answer,

1. It is designed to secure the Continuance and Perpetuity of the several Species; which, if they did not multiply exceedingly, scarce any of them could escape the Ravine of so many Enemies as continually assault and prey upon them, but would endanger to be quite destroyed and lost out of the World.

*371
2. This vast Multitude of Insects is useful to Mankind, if not immediately, yet mediately. It cannot be denied, that Birds are of great Use to us; their Flesh according us a good Part of our Food, and that the most delicate too, and their other Parts Physick, not excepting their very Excrements. Their Feathers serve to stuff our Beds and Pillows, yielding us soft and warm Lodging, which is no small Convenience and Comtort to us, especially in these Northern Pats of the World. Some of them have also been always employed by Military Men in Plumes, to adorn their Crests, and render them formidable to their Enemies. Their Wings and Quills are made use of for Writing-Pens, and to brush and cleanse our Rooms, and their Furniture. Besides, by their melodious Accents they gratify our Ears; by their beautiful Shapes and Colours, they delight our Eyes, being very ornamental to the World, and rendring the Country where the Hedges and Woods are full of them, very pleasant and chearly, which without them would be no less lonely and melancholy. Not to mention the Exercise, Diversion, and Recreation, which some of them give us.

Now Insects supply Land-Birds the chiefeat Part of their Sustenance: some, as the entire Genus of Swallows, living wholly upon them, as I could easily make out, did any Man deny or doubt of it: And not Swallows alone, but also Wood-peckers, if not wholly, yet chiefly; and all other sorts of Birds partly, especially
in Winter-time, when Insects are their main Support, as appears by dissecting their Stomachs.

As for young Birds, which are brought up in the Nest by the old, they are fed chiefly, if not solely, by Insects. And therefore for the time when Birds for the most part breed in the Spring, when there are Multitudes of Caterpillars to be found on all Trees and Hedges. Moreover, it is very remarkable, that of many such Birds, as when grown up, feed almost wholly upon Grain, the young ones are nourished by Insects. For Example, Pheasants and Partridges, Which are well known to be granivorous Birds, the Young live only or mostly upon Ants Eggs. Now Birds, being of a hot Nature, are very voracious Creatures, and eat abundantly, and therefore there had need be an infinite Number of Insects produced for their Sustenance. Neither do Birds alone, but many sorts of Fishes feed upon Insects, as is well known to Anglers, who bait their Hooks with them. Nay, which is more strange, divers Quadrupeds feed upon Insects, and some live wholly upon them, as two sorts of Tamanduus upon Ants, which therefore are called in English Ant-Bears; the Camelion upon Flies; the Mole upon Earth-Worms: The Badger also lives chiefly upon Beetles, Worms, and other Insects.

Here we may take Notice by the way, That because so many Creatures live upon Ants and their Egggs, Providence hath so ordered it, that

they should be the most numerous of any Tribe of Insects that we know.

Conformable to this Particular, is the Reason my ingenious and inquisitive Friend Mr. Derham, before remembred, hath given of the Production of such innumerable Multitudes of some Aquatick Insects.

I have often thought, (saith he) that there was some more than ordinary Use in the Creation for such Insects as are vastly numerous; such as the Pulices Aquatici, which are in such Swarms, as to discolour the Waters, and many others: And therefore I have bent my Enquiries to find out the Uses of such Creatures; wherein I have so far succeeded, as to discover, that those vastly small Animalcula, not to be seen without a Microscope, with which the Waters are replete, serve for Food to some others of the small Insects of the Waters, particularly to the Nympha culicaria [Hirsuta it may be called] figured in Swammerdam. For viewing that Nympha one Day, to observe the Motion of its Mouth, and for what Purpose it is in such continual Motion; whether as Fish to get Air, or to suck in Food, or both, I could plainly perceive the Creature to suck in many of these most minute Animalcula, that were swimming briskly about in the Water. Neither yet do these Animalcules serve only for Food to such Nymphae, but also to another to me anonymous Insect of the Waters, of a dark Colour; cleft as it were in sunder, and scarce so big as the smallest Pin's Head. These

Insects hunt these Animalcules, and other small Creatures that occur in the Water, and devour them: And I am apt to think, although I have not yet Seen it, that the Pulex aquaticus arborescens liveth upon these or more minute and tender Animalcules, and that it is to catch them that it so leaps in the Water.
This to me seems a wonderful Work of God, to provide for the minutest Creatures of the Waters, Food proper for them, that is, minute and tender, and fit for their Organs of Swallowing.

As for noxious Insects, why there should be so many of them produced, if it be demanded, I answer, 1. That many that are noxious to us, are salutary to other Creatures; and some that are Poison to us, are Food to them. So we see the Poultry-kind feed upon Spiders. Nay, there is scarce any noxious Insect, but one Bird or other eats it, either for Food or Physick. For many, nay, most of those Creatures, whose Bite or Sting is poisonous, may safely be taken entire into the Stomach. And therefore it is no wonder, that not only the Ibis of Egypt, but even Storks and Peacocks prey upon and destroy all sorts of Serpents, as well as Locusts and Caterpillars.

2. Some of the most venomous and pernicious of Insects afford us noble Medicines, as Scorpions, Spiders, and Cantharides.

3. These Insects seldom make use of their offensive Weapons, unless assaulted or provoked in their own Defence, or to revenge an Injury. Let them but alone, and annoy them not, nor disturb their Young, and unless accidentally, you shall seldom suffer by them.

Lastly, God is Pleased sometimes to make use of them as Scourges, to chaitize or punish wicked Persons or Nations, as he did Herod, and the Egyptians. No Creature so mean and contemptible, but God can, when he Pleases, produce such Armies of them as no humane Force is able to conquer or destroy, but they shall of a sudden consume and devour up all the Fruits of the Earth, and whatever might serve for the Sustenance of Man, as Locusts have often been observed for to do.

Did these Creatures serve for no other Use, as they do many; yet those that make them an Objection against the Wisdom of God, may (as Dr. Cockburn well notes) as well upbraid the Prudence and Policy of a State for keeping Forces, which generally are made up of very rude and insolent people, which yet are necessary, either to suppress Rebellions, or punish Rebels, and other Disorderly and vicious Persons, and keep the World in quset.

From that Part of this Discourse which relates to the Body of Man, I shall make these Practical Inferences.

Inference 1. First, Let us give Thanks to Almighty God for the Perfection and Integrity of our Bodies. It would not be amiss to put it into the Eucharistical part of our daily Devotions: “We praise Thee, O God, for the due Number, Shape, and Use of our Limbs and Senses; and in general, of all the parts of our Bodies; we bless thee for the sound and healthful Constitution of them Psalm C. “It is thou that hast made us and not we ourselves; in thy Book were all our Members written.”

The Formation of the Body is the Work of God, and the whole Process thereof attributed to him, Psalm CXXIX. 13,14,15. /1717>

The Mother that bears the Child in her Wmb, is not conscious to any thing that is done there; she understands no more how the Infant is formed, than itself doth. But if God hath bestowed upon us any peculiar Gift or Endowment, wherein we excell others, as Strength, or
Beauty, or Activity, we ought to give him special Thanks for it, but not to think the better of ourselves therefore, or despise them that want it.

Now, because these bodily Perfections, being common Blessings, we are apt not at all to consider them, or not to set a just Value on them; and because the Worth of Things is best discerned by their Want, it would be useful sometimes to imagine or suppose ourselves, by some Accident, to be deprived of one of our Limbs or Senses, as a Hand, or a Foot, or an Eye; for then we cannot but be Sensible, that we should be in worse Condition than now we are, and that we should soon find a Difference between two Hands and one Hand, two Eyes and one Eye, and that two excell one as much in Worth as they do in Number; and yet, if we could spare the Use of the lost Part, the Deformity and Unsightliness of such a Defect in the Body, would alone be very grievous to us. Again, which is less, suppose we only, that our Bodies want of their just Magnitude, or that they, or any of our Members are crooked or distorted, or disproportionate to the rest, either in Excess or Defect; nay, which is least of all, that the due Motion of any one Part be perverted, as, but of the Eyes in Squinting, the Eye-Lids in Twinkling, the Tongue in Stammering, these Things are such Blemishes and Offences to us, by making us Gazing-Stocks to others, and Objeces of their Scorn or Derision, that we could be conten to part with a good Part of our Estates to repair such Defeets, or heal such Infirmities.

These Things considered, and duly weighed, would surely be a great and effectual Motive to excite in us Gratitute for this Integrity of our Bodies, and to esteem it no small Blessing, I say, a Blessing and Favour of God to us; for some there be that want it, and why might not we have been of that Number? God was no way obliged to bestow it upon us!

And as we are to give Thanks for the Integrity of our Body, so are we likewise for the Health of it, and the sound Temper and Constitution of all its Parts and Humours; Health being the principal Blessing of this Life, without which we cannot enjoy, or take Comfort in any thing besides.

Neither are we to give Thanks alone for the first Collation of these Benefits, but also for their Preservation and Continuance. God preserves our Souls in Life, and defends us from Dangers and sad Accidents, which do so beset us on every side, that the greatest Circumspection in the World could not secure us, did not his good Providence continually watch over us. We may be said to walk and converse in the midst of Snares; besides, did we but duly consider the Make and Frame of our Bodies, what a Multitude of minute Parts and Vessels there are in them, and how an Obstruction in one redounds to the Prejudice of the whole, we could not but wonder how so curious an Engine as Man's Body could be kept in tune one Hour, as we use it, much less hold out so many Years? How it were possible it should endure such Hardships, such Blows, so many Shocks and Concussions, nay, such Violences and Outrages as are offered it by our frequent Excesses, and not be disordered and rendered useless; and acknowledge the transcendent Art and Skill of him who put it together, as to render it thus firm and durable.
Inference 2. Secondly, Have a care thou dost not by any vicious Practice deface, marr, or destroy the Workmanship of God. So use this Body as to preserve the Form and Comeliness, the Health and Vigour of it.

1. For the Form and Beauty of the Body, which Mankind generally is fond enough of; and which must be acknowledged to be a Natural Endowment and Blessing of God, a thing desirable, which all Men take Complacency in; which renders Persons gracious and acceptable in the Eyes of others; of which yet we do not observe, that Brute Beasts take any Notice at all: Of this I shall observe, that outward Beauty is a Sign of inward; and that handsome Persons are naturally well inclined, till they do either debauch themselves, or are corrupted by others; and then with their Manners they marr their Beauty too. For a Man may observe, and easily discern, that as Persons are better or worse inclined, the very Air of their Visage will alter much; and that vicious Courses, "defacing the inward Pulchritude of the soul, do change even the outward Countenance into an abhor'd Hue <margin> Dr. More.</margin> : As is evident in the Vices of Intemperance and Anger, and may, by sagacious Persons, be observed in others also. No better

*380
Cosmeticks than a severe Temperance and Purity, a real and unaffected Modesty and Humility, a gracious Temper and Calmness of Spirit, a Sincere and Universal Charity. No true Beauty without the Signatures of these Graces in the very Countenance. They, therefore, who through the contrary Vices do deface and blot out this natural Character and Impress, and do Violence to their own Inclinations, that sacrifice this Jewel to their Lusts, that reject this Gift of God, and undervalue the Favour of Man, aggravate their Sin and Misery, and purchase Hell at somewhat a dearer Rate than others do. And those that have but a mean Portion of this Gift, are the more obliged by vertuous Practice, not only to preserve, but to improve it. Virtue, (as Cicero observes) if it could be seen with Corporeal Eyes, admirables sui Amores excitaret</latin>; it would excite a wonderful Love of itself. By the Signatures it there impresses, it is in some Measure visible in the Faces of those that practise it, and so must needs impart a Beauty and Amiableness to them.

Diogenes Laertius, in the Life of Socrates, tells us, that that Philosopher was wont to advise young Men, <greek>suneches katoptrizesthai </greek>, often to behold themselves in their Looking Glasses or Mirrors. Grammercy, Socrates, that is good Counsel indeed ! Will our young Gentlemen and Ladies be ready to say, we like it *381 very well, and we practise accordingly ? And it seems we are injuriously taxed and reprehended by Divines, for spending so much time between a Comb and a Glass. Be not over-hasty; take what remains along with you: Mark the End for which the Philosopher exhorts this, <greek>hin ei men kaloi eien, axioi gignointo, ei d’aischroi paideia tEn duseideian epikaluptoien</greek>, That if they be handsomc, they might approve themselves worthy of their form; but if they be otherwise, they mlay by Discipline and Institution hide their Deformity, And so by their virtuous Behaviour compensate the Hardness of their Favour, and by the Pulchritude of their souls, make up what is wanting in the Beauty of their Bodies. And truly, I believe, a virtuous soul hath Influence upon its Vehicle, and adds a Lustre even to the outward Man, shining forth in the very Face.

2. So use the Body, as to preserve the Health and Vigour, and consequently produce the Life of it. These are things that all Men covet. No more effectual Means for the Maintenance and Preservation of them, than a regular and virtuous Life. That Health is impaired by Vice, daily Experience sufficiently evinceth. I need not spend Time to prove, what no Man doth or
can deny. And as for Length of Days, we find by the same Experience, that intemperate and disorderly Persons are, for the most part, Short-liv'd: Moreover, immoderate Cares and Anxiety are observed

*382
suddenly to bring gray Hairs upon Men, which are usually the Signs and Forerunners of Death. And, therefore, the way to live long, must needs be in all Points to use our Bodies, so as is most agreeable to the Rules of Temperance, and Purity, and right Reason. Every Violence offered to it, weakens and impairs it, and renders it less durable and lasting. One Means there is, which Physicians take Notice of, as very effectual for the Preservation of Health, which I cannot here omit, that is, a quiet and cheerful Mind, not afflicted with violent Passions, or distracted with immoderate Cares; for these have a great and ill Influence upon the Body. Now, how a Man can have a quiet and cheerful Mind under a great Burthen and Load of Guilt, I know not, unless he be very Ignorant, or have a seared Conscience. It concerns us, therefore, even upon this Account, to be careful of our Conversations, and to keep our Consciences void of Offence, both toward God, and toward Men.

Inser. 3. Thirdly, Did God make the Body? Let him have the Service of it, Rom. xii. 1. “I beseech you, Brethren, by the Mercies of God, that you present your Bodies a living Sacrifice, Holy, acceptable unto God, which is your reasonable Service. How we should do that, St. Chrysostom tells us in his Commentary upon this Place, <greek>

*383
, etc. Let the Eye behold no evil thing, and it is made a Sacrifice; let the Tongue speak no filthy Word, and it becomes an Oration: Let the Hand do no unlawful action, and you render it a Holocaust. Yet it was not enough thus to restrain them from Evil; but they must also be employed and exercised in doing that which is good: the Hand in giving Alms, the Tongue in blessing them that curse us and spitefully use us, the Ear in hearkening to divine Lectures and Discourses,

1 Cor. vi. 20. “Glorify God in your Body, or with your Body, and in your Spirits, which are God’s”; and that not by Redemption only, of which the Apostle there speaks, but by Creation also. Rom. vi. 13. “Neither yield ye your Members as Instruments of Unrighteousness unto Sin, but as Instruments of Righteousness unto God.” And again, ver. 19. “Even so now yield your Members Servants of Righteousness unto Holiness.” I shall Instance in two Members, which are especially to be guarded and restrained from Evil, and employed in the Service of God. <**227>

First, The Eye. We must turn away our Eyes from beholding Vanity, as David prayed God would his, Psalm. cxix. 37. We must “make a Covenant with our Eyes”, as Job did, Job xxxi. 1. These are the windows that let in exterior Objects to the soul: By these the

*384
Heart is affected; this way Sin entered first into the World. Our first Parent saw, that the Tree and its Fruit was pleasant to the Eyes, and so was invited to take and eat it. There are four Sins especially for which the Eye is noted, as either discovering themselves in the Eyes, or whose Temptations enter in by, and so give Denomination to the Eye.

1. There is a proud Eye, Prov. xix. 13. “There is a Generation, O how lofty are their Eyes! And their Eye-lids are lifted up”, Chap. vi. 17. A proud Look is reckoned the First of those
Things that God hates, Psalm. xviii. 27 “God (the Psalmist saith) will bring down proud or high Looks, Psalm. ci. 5. “Him that hath a high Look and a proud Heart (saith David) I will not suffer.” And in Psalm. cxxxi. 1. he saith of himself, that “his Heart is not haughty, nor his Eyes lofty”. By which Places it appeareth that Pride sheweth forth itself in the Eyes especially, and that they are, as it were, the Seat or Throne of it. **<228>**

2. There is a wanton Eye, which the Prophet Isaish speaks of in his third Chapter, at the 16th Verse, Because the Daughters of Jerusalem walk with stretched-out Necks, and wanton Eyes. The Apostle Peter, in his Second Epistle, ii. 24. mentions “Eyes full of Adultery”; For by these Casements enter in such Objects, as may provoke and stir up adulterous Thoughts in the Mind, as they did in David's; and likewise impure Thoughts conceived in the Heart, may discover themselves by the Motions of the Eye. And, therefore, in this respect we should do well, with holy Job, to make a Covenant with our Eyes; not to gaze upon any Objects which may tempt us to any inordinate Appetite or Desire. For our Saviour tells us, it were better to pluck out our right eye, than that it should be an offence to us: Which I suppose refers to this Matter, because it immediately follows those Words, “He that looketh upon a Woman to lust after her, hath already committed Adultery with her in his Heart.”

3. There is a covetous Eye. By Covetousness, I understand, not only a Desiring what is another Man's, which is forbidden in the Tenth Commandment, but also an inordinate Desire of Riches, which the Apostle John seems to understand in his First Epistle, ii. 16. “by the Lust of the Eye”. And Covetousness may well be called the Lust of the Eye, because, 1. The Temptation or tempting Object enters by the Eye. So the seeing the Wedge of Gold, and Babylonian Garment, stirred up the covetous Desire in Achan. 2. Because all the Fruit a Man reaps of Riches, more than will furnish his Necessities and Conveniencies, is the Feeding of his Eye, or the Pleasure he takes in the beholding of them, Eccles. v. 11. “When Goods increase, &c. what Good is there to the Owners thereof, saving the Beholding them with their Eyes?”

4. There is an envious Eye, which, by our Saviour, is called an evil Eye, Matth. xx. 15 ; “Is thine Eye evil because I am good?” That is, enviest thou thy Brother, because I am kind to him. And, vii. 22. One of those evil Things which proceed out of the Heart and defile a Man, is an evil Eye. Envy is a repining at the Prosperity or good of another, or Anger and Displeasure at any Good of another which we want, or any Advantage another hath above us. As in the Parable of the Labourers in the Vineyard, those that came in first envied the last, not because they received more than they but because they received equal Wages for less Time. Those that are subject to this Vice cannot endure to see another Man thrive, and are apt to think his Condition better than theirs when indeed it is not. **<230>**

Let us then so govern our Eyes, that we discover by them none of these Vices. Let the Humility and Purity of our Minds appear even in our outward Looks. Let neither Pride nor Lust manifest themselves in the Posture or Motions of our eyes. Let us have a care, that these Members be neither the Inlets nor Outlets of any of the fore-mentioned Vices; that they neither give Admission to the Temptation,
nor be expressive of the Conception of them. Let us employ them in reading the Word of God, and other Books, for the Increase of our Knowledge, and Direction of our Practice; in diligently viewing and contemplating the Works of the Creation, that we may discern and admire the Footsteps of the Divine Wisdom easily to be traced in the Formation, Disposition, and Designations of them. Let us take notice of any extraordinary Events and Effects of God's Providence towards ourselves or others, Personal or National: That as they are the issues of his Mercy or Justice, they may stir up suitable Affections in us of Thankfulness or Fear. Let those sad and miserable objects that present themselves to our Sights move us to Pity and Commiseration: And let our Eyes sometimes be exercised in Weeping for the Miseries and Calamities of others, but especially for our own and their Sins. <**231>

Secondly, Another Member I shall mention is the Tongue, which, as it is the chiet Instrument of Speech, so it may be well or ill employed in the Exercise of that Action, and therefore stands in need of Direction and Restraint. I remember I once heard from an ingenious Anatomist of Padua this Observation, That there are but two Members in the Body that have a natural Bridle, both which do very much need it; the Tongue, and another I shall not name. The Signification whereof may be, that they are not to be let loose, but diligently curbed and held in. <*1717> That the Tongue needs a Bridle, you will readily grant, if you read what the Apostle hath written of it, Cz~np sii. 6. Xxe Tongue is a Fire, # Wcrlh of Izliquit.y: Sa is the Lozlgz;?zze among our Rлемberr, that it defleth the Je whole Body, and retteth on l7;e the Coue*0e of Nature, and is Jbet on Fire of Hell. FoF every Kind of Beaser, and of Birds) and of Seepepents, and of TzJings in the Sea, is tamed, and hath been tanted of Mankind; but the Tongue cas1 7z0 Man tame; it is an tinruly Evil, full of deadly Poison. </1717>

For the better Government of the Tongue, I shall note some Vices of Speech, which must carefully be avoided. First of all, Loquacity, or Garrulity. This the Contrivance of our Mouths suggests to us. Our Tongues are fenced and guarded with a double Wall, or Mound of Lips and Teeth, that our Words might not rashly and unadvisedly slip out. Then Nature hath furnished us with two Ears, and but one Tongue, to intimate, that we must hear twice so much as we speak. Why Loquacity is to be avoided, the Wise Man gives us a sufficient Reason, Prov. x. 19. “In the multitude of Words there wanteth not Sin.” And, Eccles. v. 7. “In many Words there are divers vanities.” To which we may add another, of great Force <**232> with most Men, viz. That it hath been always esteemed an Effect and Argument of Folly, Eccles. v. 3. “A Fool’s Voice is known by multitude of Words.” And on the contrary, to be of few Words is a sign of Wisdom and he that is wise enough to be silent, though a Fool, may pass undiscovered. Besides all this, a talkative Person must needs be impertinent, and speak many idle Words, and so render himself burthensome and odious to Company; and may perchance run himself upon great Inconveniencies, by blabbing out his own or others Secrets; for a Word once uttered, fugit irrevocabile, is irrevocable, whatever the Consequence of it be. Great need, therefore, have we to set a Watch over our Mouthr, and to keep the Door of our Lips, <1717> Psalm cxli. 3. </1717> and not suffer our Tongues <greek> <margin>runs before the understanding or wit</margin> as Socrates phraseth it

Secondly, Lying, or false Speaking. There is difference between Mentiri and Mendacium dicere, that is, Lying, and speaking of an Untruth, or thing that is false. Mentiri, is contra
mentem ire, which though it be no good Etymology of the Word, is a good Notion of the Thing; that is, to go against one's Mind, or speak what one does not think. <greek> , as Homer expresses it, to conceal one thing in the Mind, and speak another with the <**233> Tongue. Hence a Man may speak an Untruth,

*390
and yet not lye, when he thinks he speaks the Truth; and on the contrary, may speak what is materially true, and yet lye, when he speaks what he thinks not to be True. The Tongue was made to be the Index of the Mind, Speech the Interpreter of Thought; therefore there ought to be a perfect Harmony and Agreement between these two. so that Lying is a great Abuse of Speech, and a perverting the very End of it, which was to communicate our thoughts one to another. It hath also an ill Principle, for the most part proceeding either from Baseness of Spirit, or Cowardice, as in them that have committed a Fault and deny it, for fear of Punishment or Rebuke: <1717> And, therefore, the ancient Persians, as Xenophon tells us in his Kup8 7: . made it one of the three T hings they diligently taught thes Claildren; which Irrere ~XtEVE~V, Zx2to5evErvs xa'a aas veiv- To Hide, to Shoot, and to Jpeak the 7rzsth: 

<1717> Or from Covetousness, as in Tradesmen, who falsely commend their Commodities, that they may vend them for a greater Price; or from Vanity and Vain Glory, in them who falsely boast of any Quality or Action of their own. It is odious both to God and Man. To God, Prov. vi. 17. “A Lying Tongue” is one of those six or seven Things that are an “Abomination to Him”. To Men, as Homer witnesseth in the Verse preceding the fore-quoted.

<greek> <**234>
*391
“He that tells Lies is as hateful to me, as the Gates of Hell or Death.” - The Practice of Lying is a Diabolical Exercise, and they that use it are the Devil's Children, as our Saviour tells us, John viii. 44. “Ye are of your Father the Devil, &c. for he is a Lyar, and the Father of it.” And, lastly, it is a Sin that excludes out of Heaven, and depresses the soul into Hell, Rev. xxi. 8. “All Liars shall have their part in the Lake which burns with Fire and Brimstone, which is the second Death.”

Thirdly, another Vice or Abuse of Speech, or vicious Action to which the Tongue is Instrumental, is slandering; that is, raising a false Report of any Man tending to his Defamation. This might have been comprehended under the former Head, being but a Kind of Lying proceeding from Enmity or Ill-Will. It is a very great Injury to our Neighbour; Mens Reputation being as dear to them as Life itself: so that it is grown to be a Proverb among the Vulgar, “Take away my good Name and take away tny Life.” And that which enhances this Injury, is that it is irreparable. We cannot, by any contrary Declaration clear the Innocency of our Neighbour, as wholly to extirpate the preconceived Opinion out of the Minds of those to whom our Confession

*392
comes; and many will remain whom the Calumny hath <**235> reach'd, to whom the Vindication probably will not extend; the Pravity of Man’s Nature being more apt to spread and divulge an ill Report, than to stop and silence it. I might Instance in Flattering of others, and boasting of ourselves for two Abuses of Speech; but they may both be referred to Lying, the one to Please others, and puff them up with self-Conceit, and a false Opinion, that they have some excellent Quality or Endowment, which they want, or have not in such a Degree, or that they are better thought of by others, than indeed they are, and more honoured: The other, to gain more Honour than is due to ourselves <1691 to them>.
Neither yet is it Boasting only of what we have not, but also what we have, condemned and disallowed by God and Men, as being contrary to that Humility and Modesty that ought to be in us, Prov. xxvii. 2. “Let another Man praise thee, and not thine own Mouth; a Stranger, and not thine own Lips.” And moralists proceed so far as to censure all unnecessary <greek>periautologia</greek>, that is, Talking of a Man's self. </1717>

Fourthly, obscene and impure Words are another vicious Effect of the Tongue. Those are principally the <greek>sarko logoi</greek>, rotten Speeches the Apostle speaks of, Eph. v. 29. Such as chaste Ears abhor, which tend only to the depraving and corrupting the Hearers: and are to be studiously

*393

and carefully avoided by all that pretend to Christianity, Eph. v. 3. “But Fornication, and all uncleanness, let it not be once named among you.”

Fifthly, Cursing, and railing or reviling Words, are also a great Abuse of Speech, and outrageous Effects and Expressions of Malice and Wickedness, Psalm. x. 7. The Psalmist makes it part of the Character of a wicked <**236> Man, that “His Mouth is full of Cursing.” Which Passage we have quoted by the Apostle, Rom. iii. 14. “Whose Mouth is full of cursing and bitterness.”

Sixthly, Swearing, and irreverently using the Name of God in common Discourse and Converse, is another Abuse of the Tongue; to which I might add vehement Asseverations upon slight and trivial occasions. I do not deny, but in a Matter of Weight and Moment, which will bear out such Attestation, and where Belief will not be obtained without them, and yet it may much import the Hearer or Speaker that his Words be believed, or where the Hearer would not otherwise think the Matter so momentous or important as indeed it is, Protestations and Asseverations, yea, Oaths may lawfully be used. But to call God to witness to an Untruth or a Lye perhaps, or to appeal to Him on every trivial Occasion, in common Discourse, customarily, without any

*394

Consideration of what we say, is one of the highest Indignities and Affronts that can be offered him, being a Sin to which there is no Temptation: For it is so far from gaining Belief, (which is the only Thing that can with any shew of Reason be pleaded for it) that it rather creates Diffidence and Distrust. For as <latin>“multa fidem promissa levant”, so “multa Juramenta”</latin> <**237> too; it being become a Proverb, “He that will Swear will Lie.” And good Reason there is for it, for he that scruples not the Breach of one of God's Commands, is not likely to make Conscience of the Violation of another.

Lastly, (For I will name no more) Scurrilous Words, Scoffing, and Jeering, Flouting and Taunting, are to be censured as Vicious Abuses of Speech.

This Scoffing and Derision proceeds from Contempt, and that of all Injuries Men do most impatiently bear; nothing offends more or wounds deeper: And, therefore, what greater Violation of that general Rule of Christian Practice, “to do to others as we would they should do unto us?” This Injury of being derided, the Psalmist himself complains of, Psalm lxix. 11,12. “I became a Proverb to them. They that sit in the Gate, speak against me, and I was the song of the Drunkards.” And, Psalm xxxv. 15. according to the Church Translation, “The very Abjects came together against me unawares, making Mows at me, and ceased
not”; and the Prophet Jeremy, Jer. xx. 7. “I am in Derision daily, every one mocketh me.” And though there may be some Wit shewn in Scoffing and Jesting upon others, yet is it a practice inconsistent with true Wisdom. The Scornor and the Wise Man are frequently opposed in Scripture, Prov. ix. 8. and Chap. xiii. 1. etc. It is a Proverbial Saying, “The greatest Clerks are not always the wisest men”. I think the Saying might as often be verified of the greatest Wits. Scorning, in that Gradation in the first Psalm, is set down as the highest Step of Wickedness. And Solomon tells us, “That judgments are prepared for the Scorners”.

You will say to me, How then must our Tongues be employed; I answer,

1. In Praises and Thanksgiving unto God, Psalm xxxv. 28. “And my tongue shall speak of thy Righteousness and of thy Praises all the day long”. Parallel whereto, is verse 24 of Psalm lxxi. Indeed, the Book of Psalms is, in a great Measure, but an Exercise of, or Exhortation for this Duty.
2. We must exercise our Tongues in talking of all his wondrous Works; Psalm cxl. 5.6. “I will speak of the glorious Honour of thy Majesty, and of thy wondrous Works”.
3. In Prayer to God.
4. In Confession of Him, and his Religion, and publickly owning it before Men, whatever the Hazard be.
5. In Teaching, Instructing, and Counselling of others.
6. In Exhorting them.
7. In Comforting them that need it.
8. In Reproving them.

All which Particulars I might enlarge upon; but because they come in here only as they refer to the Tongue, it may suffice to have mentioned them summarily.

Thirdly, Let us hence learn duly to prize and value our Souls. Is the Body such a rare Piece, what then is the Soul? The Body is but the Husk or Shell, the soul is the Kernel; the Body is but the Cask, the Soul the precious Liquor contained in it; the Body is But the Cabinet, the Soul the Jewel; the Body is but the Ship or Vessel, the Soul the Pilot; the Body is but the Tabernacle, and a poor Clay Tabernacle or Cottage too, the Soul the Inhabitant; the Body is but the Machine or Engine, the Soul that, that actuates and quickens it; the Body is but the dark Lantern, the Soul or Spirit is the Candle of the Lord that burns in it: And seeing there is such Difference between the Soul and the Body in respect of Excellency, surely our better Part challenges our greater Care and Diligence to make Provision for it. Bodily Provision is but half Provision, it is but for one Part of a Man, and that the meaner and more ignoble too, if we consider only the Time of this life; but if we consider a future Estate of endless Duration after this Life, then Bodily Provision will appear to be, I do not say quarter Provision, but no Provision at all in Comparison; there being no Proportion.

between so short a Period of Time, and the infinite Ages of Eternity. Let us not then be so foolish, as to employ all our Thoughts, and bestow all our Time and Pains about cherishing, accommodating and gratifying our Bodies, in “making Provision for the Flesh to Assist the Lust thereof”, as the Apostle phraseth it; and suffer our souls to lie by neglected, in a miserable, and poor, and blind, and naked Condition. Some Philosophers will not allow the Body to be an essential Part of Man, but only the Vessel or Vehicle of the soul; <latin>Anima cuiusque est quisque</latin>: The soul is the Man. Though I would not be so
unequal to it, yet I must needs acknowledge it to be but an inferiour Part: It is therefore so to be treated, so dieted and provided, as to render it most calm and compliant with the soul, most tractable and obsequious to the Dictates of Reason; not so pampered and indulged, as to encourage it to cast its Rider, and to take the Reins into its own Hand, and usurp Dominion over the better Part, the \text{to hEg??}/, to sink and depress it into a sordid Compliance with its own Lusts, \text{Atque assigere humi Divinae particulam aurae}/.

This is our Duty, but alas what is our Practice? Our great Partiality towards our Bodies, and Neglect of our souls, shews \text{clearly which Part we prefer}. We are careful enough of wounding or maiming our Bodies, but we make bold to lash and wound our

\*398

Souls daily; for every Sin we commit, being contrary to its Nature, is a real Stripe, yea a mortal Wound to the soul, and we shall find it to be so, if our Consciences be once awakened to feel the Sting and Smart of it. We are industrious enough to preserve our Bodies from Slavery and Thraldom, but we make nothing of suffering our souls to be Slaves and Drudges to our Lusts, and to live in the vilest Bondage to the most degenerate of Creatures, the devil: We are thrifty and provident enough not to part with anything that may be serviceable to our Bodies under a good Consideration, and we so esteem them, as that we will part with all we have for the Life of them; but we make little Account of what is most beneficial to our souls, the means of Grace and Salvation, the Word of God and Duties of his Worship and Service; nay, we can be content to sell our souls themselves for a Trifle, for a Thing of nothing, yea for what is worse than nothing, the Satisfying of an inordinate and unreasonable Appetite or Passion. We highly esteem and stand much upon our Nobility, our Birth and Breeding; though we derive nothing \text{from our Ancestors but our Bodies} and Corporeal Qualities; and it is useful so far to value and improve this Advantage, as to provoke us to imitate the good Examples of our Progenitors, not to degenerate from them, nor to do any thing unworthy of our Breeding; and yet the divine

\*399

Original of our Souls, which are Beams from the Father of Light, and the immediate Offspring of God himself, \text{hath little Influence upon us to engage us to walk worthily of our Extraction, and to do nothing that is Base or ignoble, and unsuitable to the Dignity of our Birth.}

You will say, how shall we manifest our Care of our Souls? What shall we do for them? I Answer, the same we do for our Bodies.

First, We feed our Bodies, our Souls are also to be fed: The Food of the Soul is Knowledge, especially Knowledge in the Things of God, and the Things that concern its Eternal Peace and Happiness; the Doctrine of Christianity, the Word of God read and preached, 1 Pet. ii. 2. \text{As new born Babes desire the sincere Milk of the Word, that ye may grow thereby”} Heb. v. 12. The Apostle speaks both of Milk and of strong Meat. Milk he there calls the Principles of the Doctrine of Christ: And again, 1 Cor. ii. 3. “I have fed you with Milk and \text{not with Meat, for hitherto ye were not able to bear it”}. So we see in the Apostles Phrase, Feeding of the Flock, is Teaching and Intructing of them. Knowledge is the Foundation of Practice; it is impossible to do God's Will before we know it; the Word must be received into an honest and good heart and

\*400

understood, before any Fruit can be brought forth.
Secondly, we heal and cure our Bodies, when they are inwardly sick, or outwardly harmed: Sin is the Sickness of the Soul, Matth. ix. 12. “They that be whole need not a Physician, but they that be sick”, saith our Saviour by way of Similitude, which he explains in the next Verse, “I am come not to call the Righteous, but Sinners to Repentance.” For the Cure of this Disease, an humble, serious, hearty Repentance, is the only Physick; not to expiate the guilt of it, but to qualify us to partake of the Benefit of that Atonement which our Saviour Christ hath made, by the Sacrifice of Himself, and restore us to the Favour of God, which we had forfeited, it being as much as in us lies an Undoing again what we have done.

Thirdly, we cloath and adorn our Bodies, indeed too much Time and too many Thoughts we bestow upon that; our Souls also are to be cloathed with holy and Virtuous Habits, and adorned with good Works, 1 Pet. v. 5. “Be ye cloathed with Humility”; And in the same Epistle, Chap. ii. 2. he exhorts Women to “adorn themselves, not with that outward adorning of plaiting the Hair, and of wearing Gold”, etc. but with “the Ornament of a meek and quiet Spirit, which is in the Sight of God of great Price”.

*401
And in Rev. xix. 8. The Righteousness of the Saints” is called “fine Linen”. And the Saints are said to be “cloathed in white Raiment”, Matth. xxiii. 11. Works of Righteousness, and a Conversation becoming the Gospel, is called “a wedding Garment”, Coloss iii. 10. “Put on the new Man”. And again, “Put on therefor as the Elect of God, Bowels of Mercy, Meekness”, &c. On the contrary vicious Habits and sinful Actions are compared to Filthy Garments. So, Zech. iii. 3. “Joshua” the High-Priest is said to be “cloathed with filthy Garments”; which in the next Verse are interpreted his Iniquities, either Personal, or of the People whom he represented, “I have caused thy Iniquity to pass from thee, and will cloath thee with Change of Raiment”.

Fourthly, we arm and defend our Bodies. And our Souls have as much Need of Armour as they: For the Life of a Christian is a continual Warfare; and we have potent and vigilant Enemies to encounter withal; the Devil, the World, and this corrupt Flesh we carry about with us. We had need, therefore, to take to us the Christian Panoply, to “Put on the whole armour of God, that we may withstand in the evil day, and having done all may stand; having our Loins girt with Truth, and having the breast-plate of righteousness, and our feet shod with the preparation of the Gospel of Peace. Above all taking the shield of

*402
Faith, and for an Helmet, the Hope of Salvation, and the Sword of the Spirit, which is the Word of God”, Eph. vi. 13,14, etc.

He that with his Christian Armour manfully fights against and repels the Temptations and Assaulsts of his Spiritual Enemies; he that keeps his Garments pure, and his Conscience void of Offence towards God and towards Man, shall enjoy perfect Peace here, and Assurance for ever. Tacitus saith of the Finns, a Northern People, that they were securi adversus homines, securi adversus Deos. They need not fear what God or Man could do to them, because they were in as bad a Condition as could consist with living in the World: They could not be banished into a worse Country, nor put into worse Circumstances than they were in already. I might say of the Man that keeps a good Conscience, that he is secure against God and Man; not in that Sense the Finni were; but secure of any Evil befalling him, from either. God can do him no Harm, not for want of Power, but for want of Will, which is regulated by his Truth and Justice. He is also secure in respect of Men, because he is under the Protection of the Almighty: And if any there be that would do him
harm, they shall either be restrained by the Divine Providence, or if they be permitted to injure him, it shall tend only to the Exercise and Improvement of his Faith and Patience, and enhancing his future

*403
Reward at that great Day, when the Almighty shall dispense Aureolae to those Champions who have signalized their Valour and Fidelity by Heroick Actions, or patient Sufferings of unworthy Things for his Sake.

3. A good Conscience not only secures a Man from God and Men, but from himself too. “There is no Peace to the Wicked”, saith my God, no inward Peace. Such a Man is at Odds with himself. For the Commandments of God being agreeable to the Nature of Man, and perfectly conformable to the Dictates of right Reason; Man's judgment gives Sentence with the Divine Law, and condemns him when he violates any of them; and so the Sinner becomes an <latin> Heautontimorumenos </latin>, a Tormentor of himself. <latin>Prima est haec ultio, quod se Judice nemo nocens absolvitur </latin>; No guilty Person is absolved at his own Tribunal, himself being Judge. <**247>

Neither let any profligate Person, who hath bidden Defiance to his Conscience, and is at War with himself; think to take Sanctuary in Atheism, and because it imports him highly there should be no God, stoutly deny that there is any. For First, supposing that the Existence of a Deity were not demonstrably or infallibly proved, (as it most certainly is,) yet he cannot be sure of the contrary, that there is none. “For no Man can be sure of a pure Negative, namely, that such a thing is no, unless he will either pretend to have a certain knowledge

*404
of all Things that are or may be, than which nothing can be more monstrously and ridiculously arrogant; or else, unless he be be sure that the Being of what he denies doth imply a Contradiction; for which there is not the least Colour in this Case.” The true Notion of God consisting in this. “That he is a Being of all possible Perfection”, That I may borrow my Lord Bishop of Chester's Words, in his Discourse of Natural Religion, page 94.

Now, if he be not sure there is no Deity, he cannot be without some Suspicion and Fear that there may be one.

“Secondly, If there should be a Deity, so Holy and Just and Powerful as is supposed, what Vengeance and Indignation <**248> may such vile miscreants and rebels expect, who have made it their Business to banish Him out of the World, who is the great Creator and Governour of it; to undermine his Being, and eradicate all Notions of Him out of their own and other Mens Minds; to provoke his Creatures and Vassals to a Contempt of him, a sleighting of his Fear and Worship, as being but such imaginary Chimaeras, as are fit only to keep Fools in awe. Certainly as this is the highest Provocation that any Man can be guilty of, so shall it be punish'd with the forest Vengeance.”

Now a slender Suspicion of the Existence of a Being, the Denial whereof is of so sad Consequence, must needs disturb the Atheist's Thoughts, and fill him with Fears, and qualify

*405
and allay all his Pleasures and Enjoyments, and render him miserable even in this Life.
“But on the other side, he that believes and owns a God, if there should be none, is in no danger of any bad Consequent. For all the inconvenience of this Belief will be, that he may be hereby occasioned to tye himself up to some needless Restraints during this short time of his Life, wherein notwithstanding there is, as to the present, much Peace, Quiet, and Safety: And, as to the future, his Error shall die with him, there being none to call him to an Accouut for his Miaake.” Thus far the Bishop.

To which I shall add, that he not only suffers no Damage, but reaps a considerable Benefit from this Mistake; for during this Life he enjoys a pleasant Dream or Fancy of a future blessed Estate, with the Thoughts and Expectation whereof, he solaces himself and agreeably entertains his Time; and is in no Danger of being ever awakened out of it, and convinced of his Error and Folly, Death making a full End of him.

FINIS.
